PREVIOUS SERIES 94 BULLETINS

Bulletin No. 94 series is being published by the Department of Water Resources for the information and use of all interested agencies and the general public. Earlier bulletins in this series are:

- Bulletin No. 94-1. "Land and Water Use in Tule River Hydrographic Unit."
- Bulletin No. 94-2. "Land and Water Use in Trinity River Hydrographic Unit."
- Bulletin No. 94-3. "Land and Water Use in Yuba-Bear Rivers Hydrographic Unit." (Preliminary Edition).
- Bulletin No. 94-4. "Land and Water Use in Smith River Hydrographic Unit."
- Bulletin No. 94-5. "Land and Water Use in Shasta-Scott Valleys Hydrographic Unit." (Preliminary Edition).
- Bulletin No. 94-6. "Land and Water Use in Klamath River Hydrographic Unit." (Preliminary Edition).
- Bulletin No. 94-7. "Land and Water Use in Mad River-Redwood Creek Hydrographic Unit." (Preliminary Edition).
- Bulletin No. 94-8. "Land and Water Use in Eel River Hydrographic Unit." (Preliminary Edition).
- Bulletin No. 94-10. "Land and Water Use in Mendocino Coast Hydrographic Unit." (Preliminary Edition).
- Bulletin No. 94-13. "Land and Water Use in Putah-Cache Creeks Hydrographic Unit." (Preliminary Edition).
- Bulletin No. 94-14. "Land and Water Use in American River Hydrographic Unit." (Preliminary Edition).

DEPARTMENT OF WATER RESOURCES

P.O. BOX 388
SACRAMENTO

November 5, 1964

Honorable Edmund G. Brown, Governor
and Members of the Legislature
of the State of California

Gentlemen:

I have the honor to transmit Bulletin No. 94-3, entitled "Land and Water Use in Yuba-Bear Rivers Hydrographic Unit," the third of a series of reports of the Department of Water Resources, which present detailed basic data of land use, classification of land, water use, and apparent water rights within certain hydrographic units of the State. These studies are being conducted pursuant to legislation sponsored by Senator Edwin J. Regan and codified under Section 232 of the Water Code.

The preliminary edition of this bulletin was published in September 1963 and was subsequently distributed for review. In June 1964, the Department of Water Resources held a public hearing to receive comments from interested individuals and agencies of findings set forth in the bulletin. After consideration of these comments, necessary revisions were made.

The information contained in this series of reports will provide a basis for future estimates of the amount of water which originates within each watershed, the amount which can be used beneficially within each area, and the amount of surplus or deficiency, if any. The completed series will provide invaluable reference material relating our water resources to land classification and use.

The data presented in this bulletin will help concerned interests determine how best to develop and use the water resources of the Yuba-Bear Rivers Hydrographic Unit. The bulletin discusses history, natural features, climate, and economy of the unit. Maps of present land use and classification of lands illustrate the text.

Sincerely yours,

A handwritten signature in cursive script, reading "William E. Warne".

ACKNOWLEDGMENT

The Department of Water Resources gratefully acknowledges information contributed by the numerous water users and residents of the Yuba-Bear Rivers Hydrographic Unit and various agencies of the federal, state, and local governments.

Special mention is made of the helpful cooperation of the farm advisors of Nevada, Placer, and Yuba Counties; Pacific Gas and Electric Company; Nevada Irrigation District; Placer County Water Agency; Nevada County Water Resources Committee; and Yuba County Water Agency.

FOREWORD

In 1956, the State Legislature declared:

"... that in providing for the full development and utilization of the water resources of this State it is necessary to obtain for consideration by the Legislature and the people, information as to the water which can be made available for exportation from the watersheds in which it originates without depriving those watersheds of water necessary for beneficial use therein..."

The Department of Water Resources was therefore directed to conduct the necessary investigations to compile this information.

For purposes of these studies, the State was divided into major hydrologic areas which, in turn, were subdivided into hydrographic units, generally comprising watersheds of individual rivers. Basic data on water use, land use, land classification, streamflows, ground water, and water quality are being collected by hydrographic units throughout the State. The collection and processing of these data and the publication of the results, for use by the Legislature and all others concerned, are being accomplished in two phases.

The first phase is concerned with the land and water use and land classification data. Reports of the Bulletin No. 94 series present these data for individual hydrographic units before the other studies are completed for the same areas. Following collection and processing of this material, these bulletins are distributed in preliminary form and reviewed at public hearings. Final editions are then published including summaries of the hearings and resulting revisions. These bulletins are an essential source of data for the subsequent water requirements studies, and when complete, will provide detailed data for the entire State.

This land and water use report is the third of the series to be published in the first phase of the investigations. It is the final edition of Bulletin No. 94-3 following public hearings held in the Yuba-Bear Rivers area in June 1964.

The second phase begins with an inventory of water resources in each area, including streamflows, ground water, and water quality characteristics. Estimates of future water requirements to be based on the land and water use studies

and projections of foreseeable future development, are also being made. Results of these water resources and water requirements studies will be published in the second series of reports. These will be designated the Bulletin No. 142 series, and generally cover groups of hydrographic units.

These water resources and future water requirements bulletins will provide the basis for outlining the additional projects needed to meet the State's growing water needs. By interrelating the projected water requirements of all areas of the State with the available local supplies, by decades, a recommended sequence and timing for the State's future water development plans will be established. Besides thus forming the chief basis for the Department of Water Resources' all important project staging program, the data on water resources and water requirements will be a most valuable guide for water development planning by federal and local, as well as state agencies.

PUBLIC HEARING
on
Preliminary Edition
of
Bulletin No. 94-3,
"Land and Water Use in
Yuba-Bear Rivers Hydrographic Unit"

In accordance with Section 232 of the Water Code, the State Department of Water Resources held a public hearing on June 25, 1964, in Grass Valley, California, to receive comments from agencies, groups, and local interests on the preliminary edition of Bulletin No. 94-3, "Land and Water Use in Yuba-Bear Rivers Hydrographic Unit." The hearing was attended by about 18 persons, including local people, and representatives from state and local governmental agencies.

After consideration of both verbal and written comments, it was concluded by the department that suggested revisions be incorporated in the bulletin before final publication.

A transcript of the June 25, 1964, public hearing and copies of the department's response to written comments, are on file with the Department of Water Resources in Sacramento and are available for review by the public.

Verbal comments were made at the hearing by the following persons:

Mr. Charles R. Mathews
McCreary-Koretsky-Engineers
San Francisco, California

Miss Retha Downey
Nevada City, California

Mr. Edwin Koster
Nevada Irrigation District
Grass Valley, California

Mrs. Ida L. Fredericks
Grass Valley, California

Mr. M. E. Murphy
U. S. Bureau of Reclamation
Sacramento, California

Mr. H. J. Barnickol
U. S. Tahoe National Forest
Nevada City, California

Mr. Cecil E. Pearce
Ebasco Services Incorporated
San Francisco, California

Written comments were received from the following:

U. S. Department of Agriculture
Forest Service

Nevada Irrigation District

CHAPTER I. INTRODUCTION

This bulletin presents basic data on land and water use in the Yuba River and Bear River watersheds and adjacent lands above the Sacramento Valley floor. This area is designated herein as the Yuba-Bear Rivers Hydrographic Unit. The data cover present land and water use, classification of lands, systems used to divert surface stream waters, histories of diversions, apparent water rights pertinent to each diversion, purpose and extent of use of diversions, seasonal quantities of water diverted during part or all of the years 1957 and 1958, and studies of consumptive use of water in selected areas of the unit. A general description and a brief history of the area are also included.

These basic data were gathered during the period 1956-58 in compliance with Chapter 61, Statutes of 1956, as amended by Chapter 2025, Statutes of 1959, and codified in Section 232 of the Water Code of the State of California. The text of Section 232, with a discussion of its history and implications, is included in this bulletin as Appendix A.

These data will provide the basis for a future determination of quantities of water reasonably required for future beneficial use within the Yuba-Bear Rivers Hydrographic Unit. The determinations will be based on estimates of (1) future land use, (2) economic patterns, (3) populations, (4) industrial and agricultural development, and (5) recreational needs.

The data presented herein have been reviewed in preliminary form by local water users and officials representing Placer, Nevada, Yuba, and Sierra Counties. Placer County data received review from Placer County Water Agency, Placer County Farm Advisor, Placer County Planning Commission, and local water users; Nevada County data received review from Nevada County Water Resources Committee, Nevada County Farm Advisor, and local water users; Yuba County data received review from the Water Committee of the Yuba County Board of Supervisors and the Yuba County Farm Advisor; and Sierra County data received review from the Sierra County Board of Supervisors. These groups and individuals submitted suggested changes which were reviewed in the field and adjustments made where warranted.

Organization of Report

This bulletin consists of five chapters, four appendices and six plates. Chapter I contains a general description of the Yuba-Bear Rivers Hydrographic Unit. Chapter II, "Water Use," includes data on surface water diversion systems, related water rights information, measurements of quantities of water diverted, and information on consumptive use studies. Chapter III, "Land Use," includes a history of land use within the unit and tables of present land use. Maps prepared in connection with Chapters II and III delineate the areas of various present land uses, locations of diversion systems, and areas where consumptive use studies were made. Chapter IV,

"Land Classification," includes a tabulation of lands classified with regard to their potential for irrigated agriculture and for recreational purposes. Maps prepared for this chapter delineate the respective classes of land grouped into several major categories. Chapter V, "Summary," summarizes the report.

Appendix A presents the text of Section 232 of the California Water Code and a discussion of the pertinent responsibilities and work program of the Department of Water Resources. Appendix B is a bibliography of publications pertinent to the Yuba-Bear Rivers Hydrographic Unit. Appendix C presents a short summary of California water law, a review of litigation involving water rights in the Yuba-Bear Rivers Hydrographic Unit, and a tabulation of applications to appropriate water in the unit. Appendix D presents details of diversions which could not be adequately described in tables contained in Chapter II.

General Description of Area

Location

The Yuba-Bear Rivers Hydrographic Unit, shown on Plate 1, "Location of Unit," lies within the Sacramento River Basin in portions of Butte, Nevada, Placer, Plumas, Sierra, and Yuba Counties. The hydrographic unit contains 1,955 square miles and is drained by the Yuba River, the Bear River, and minor streams between the Yuba River on the north and Miners Ravine on the south. The two rivers meander on a generally westerly course to their terminations at the Feather River.

The minor streams south of the Bear River drain to the Sacramento River.

The unit is bounded by the watersheds of the Feather River on the north, the Truckee River on the east, and the American River on the south. On the west it is bounded by the Sacramento Valley floor, defined in part by the western boundaries of Beale Air Force Base, Nevada Irrigation District, and the City of Lincoln. Between Lincoln and Roseville, the edge of the valley floor is defined by an irregular line which approximates the 200-foot contour. The more important minor streams draining the foothill area, but not joining the Yuba or Bear Rivers within the unit boundaries, include French Dry Creek, Coon Creek, Auburn Ravine, Antelope Creek, and Miners Ravine. The unit boundary is shown in detail on the series of sheets comprising Plate 2, "Land and Water Use in Yuba-Bear Rivers Hydrographic Unit."

For purposes of convenience and utility in reporting data, the unit has been subdivided into 22 subunits. Locations of these subunits are shown on Plate 1, and the area of each is shown in Table 1.

TABLE 1

Historical and Present Development

The history of early development in the Yuba-Bear Rivers Hydrographic Unit parallels that of the California pioneers and gold miners. Many of the pioneers came west across the Sierra Nevada through this area in the latter 1840's, and the gold miners came soon thereafter. The first recorded explorations into the unit were made in about 1839 by John A. Sutter, and were confined largely to the lower foothills. The first crossing of the Sierra Nevada was made by a pioneer party headed for Sutter's Fort in 1844. In the same year the first settlement in this area was made on the north bank of the Bear River at Johnson's Crossing, located near the western boundary of the unit.

The discovery of gold at Coloma, on the South Fork of the American River in January 1848, caused a great influx of people into the Mother Lode region of California, which includes most of the hydrographic unit. These early gold seekers obtained gold from the shallow river sands and gravels by digging the flakes of gold from crevices in the bedrock of streambeds. During the period from 1848 to the early 1850's there was a very rapid advance in methods and technology, and this crude method was soon followed by the use of the miner's pan and later in turn by the miner's cradle, the long tom, and the miner's sluice box. Later the ground-sluicing method and finally hydraulic mining were developed. These improved methods were required as the easy-to-obtain shallow river

gravels became exhausted and it was necessary to wash larger and larger amounts of gravel for profitable operation. Each of the new methods required an increasingly large amount of water.

Ground sluicing and hydraulic mining developed when it was discovered that ancient sidehill gravel deposits contained gold. By the ground-sluicing method a stream of water was brought to the gravel bank and allowed to flow over its face and carry loosened gravel to a sluice below. This method brought about the discovery of hydraulic mining in 1853, just north of Nevada City by Edward E. Mattison, who found that by using a hose and nozzle a stream of water under pressure could be used to undermine and wash the gravel into sluice boxes. This was a great improvement over the other methods, and its use started the construction of a great system of reservoirs and canals needed to supply water for dozens of large mines in the Sierran Gold Belt.

Hydraulic mining was a boon to gold mining but was a great detriment to agriculture and to navigation on navigable streams in the Sacramento Valley. Large volumes of hydraulic mining debris were discharged into stream channels and by 1858 some of the debris reached lower agricultural lands of the Yuba River. By 1879 debris had caused the low-water plain at Sacramento to rise 5 to $5\frac{1}{2}$ feet. The damage done by the mining debris resulted in considerable litigation and two injunctions which were obtained practically ended hydraulic mining in the Sacramento River Basin. In 1882 an

injunction was secured in the Superior Court in Sacramento County against the Gold Run Ditch and Mining Company, and on January 7, 1884, the Federal Court granted an injunction against the North Bloomfield Gravel and Mining Company, et al. In this federal case, Wooddruff v. North Bloomfield Gravel and Mining Company, et al., Judge Lorenzo Sawyer's decision prohibited all hydraulic mining in areas tributary to the Sacramento River, except that done behind a retaining wall or dam. Very few hydraulic mines continued in operation after that time.

In 1893 the United States Congress created the California Debris Commission which, among other duties, is charged to study practical methods whereby hydraulic mining may be resumed. The Debris Commission now licenses hydraulic mining operations and requires that they be carried on behind restraining dams. In addition, the commission can make surveys of sites for, and construct, debris control structures. At the present time the commission has constructed two such structures within the Yuba-Bear Rivers Hydrographic Unit. These are the Daguerre Point Dam and the Englebright Dam on the Yuba River. In addition to these, Bullards Bar Dam constructed as a debris control structure and the Nevada Irrigation District has reserved space in two of its reservoirs for storing mining debris.

The final development in placer mining came in 1898 when dredging of gold from river beds was first successfully accomplished. The dredges have increased in capacity and efficiency so that now a modern dredge may excavate 125,000 cubic

yards of material a week with a crew of only three or four men per shift. Gold dredging has been practiced on many streams within the Yuba-Bear Rivers Hydrographic Unit, but currently the only dredging being practiced is on the Yuba River near Hammonton.

About the same time that hydraulic mining was beginning, the working of hillside gravel and outcrops by means of shafts and adits was started. This method of mining, however, has not suffered from the restrictions placed on hydraulicking, since no stream debris is created.

Gold-bearing quartz was first found in the fall of 1850 in the gold field in Grass Valley. It has been estimated that \$2 million worth of gold was taken from within a few feet of the surface of Gold Hill. The more important quartz mines in the Grass Valley area and the dates they were located are: Empire Mine, 1850; Eureka Mine, 1851; North Lone Star Mine, 1852; and Idaho Mine, 1867. The Eureka Mine ceased operation in 1914, while the others continued to operate until 1957 when the mines closed because of labor strife and the unprofitable price of gold.

Gold production in California declined rapidly from the \$80-million output of the peak year 1852, to \$18 million in 1865. In the eight-year period 1852 to 1860, the population of Nevada County decreased from 21,000 to 16,450.

Agriculture began in the Yuba-Bear Rivers Hydrographic Unit early in the history of the area because many of the miners were better farmers than miners, and, soon tiring of their

inability to find gold, resorted to farming to supply the miners with food. In 1852 the Nevada County Assessor reported that 1,587 acres were under cultivation, and that during that year this acreage produced 14,310 bushels of barley, 307 bushels of oats, 299 tons of potatoes, and 50 tons of hay. The assessor's records for this period also show there were horses; mules; horned cattle, including work animals such as oxen; hogs; and poultry being raised in the county. The growth of agriculture in the early days, as reported in the assessor's report for other years, is shown by the fact that the number of fruit trees increased from about 3,200 to about 50,000 in the five-year period from 1855 to 1860. The total cultivated acreage in 1860 is reported to have been 30,000 acres. This is a twenty-fold increase in about eight years. Although mining and population decreased after 1852, agriculture continued to increase until about 1880. The completion of the overland railroad and the depletion of the mines in Virginia City contributed to a decline in foothill agriculture at this time. With the cessation of hydraulic mining in 1884, a further decline in population and agriculture was brought about.

With the development of placer mining to a high degree, and the development of agriculture, many ditches were built to convey water from streams to the areas of use. Many ditches in use today were built in the 1850's to 1860's to support the mining industry and the growing agricultural lands. Some of these ditches, with their respective dates of construction, are Pine Grove Ditch, 1851; Newton Ditch, 1851;

Browns Valley
Ditch in
Browns Valley

Wise Powerhouse

Bear River Canal, 1852; Tunnel Ditch, 1852; Excelsior Ditch, 1859; China Ditch, 1860; Tarr Ditch, 1861; and the South Yuba Canal, the construction of which was started about 1855 and completed about 1865.

Since settlers of all types needed housing, the great influx of mining was conducive to the development of the lumber industry in the area. The first lumber mills were built in the vicinity of Grass Valley in the early spring of 1850. It is estimated that the mountains in the eastern portion of the hydrographic unit contain about 560,000 acres of commercial pine and fir timber lands, 55 percent of which are now in private ownership. The estimated sustained lumber yield is 33,000,000 board feet cut, with a 1957 dollar value of about \$2,500,000.

Auburn, Grass Valley, and Nevada City, three of the principal cities of the hydrographic unit, had their beginnings in the gold rush days of the 1850's, and have continued in their relative prominence ever since. Many of the other early mining towns, such as Gold Run, Ophir, Gold Hill, Dutch Flat, Rough and Ready, North San Juan, Downieville, French Corral, Brown's Valley, and Smartville still exist, but only in a secondary role to their one-time glory. Other communities in the hydrographic unit are Rocklin, Loomis, Penryn, Newcastle, Weimar, Lincoln, Cisco Grove, and Soda Springs. Many of the towns that flourished during the mining days, but now are just memories, had quaint and unusual names such as Warloupa, Red Dog, New Town, Turkey Flat, Alpha, Omega, Timbuctoo and Sucker's Flat.

As has been previously noted, water development in the Yuba-Bear Rivers Hydrographic Unit began in 1850 with the construction of ditches to convey water to mining developments and to serve mining communities. Hydroelectric power production began in about 1897 with the construction of two small plants, one at Auburn and one at Newcastle, both of which have since ceased to operate. At present, 12 powerplants operate in the hydrographic unit, the oldest being the Alta Powerhouse, which was constructed in 1902. The other plants are Spaulding Powerhouses No. 1, 2, and 3; Drum Powerhouse; Dutch Flat Powerhouse; Halsey Powerhouse; Wise Powerhouse; Deer Creek Powerhouse; Colgate Powerhouse; Bullards Bar Powerhouse; and Narrows Powerhouse. All of the plants are operated by the Pacific Gas and Electric Company.

Other water projects within the area include those for agriculture which are operated by the Browns Valley Irrigation District, the Nevada Irrigation District, and the Pacific Gas and Electric Company. Detailed descriptions of these hydroelectric and agricultural facilities are contained in Appendix D.

The present development of ground water in the hydrographic unit is limited almost exclusively to domestic wells and to the water supply for Beale Air Force Base on the Sacramento Valley floor. Some of the surface water which flows from the hydrographic unit serves to recharge the ground water basin of the Sacramento Valley.

Recreational pursuits in the Yuba-Bear Rivers Hydrographic Unit have reached significant commercial proportions. There are many organizational and commercial campgrounds in addition to the many camping facilities operated by the U. S. Forest Service. Hunting, fishing, and winter sports in the area have led to development of summer and winter cabins in the national forests and on private lands. Water sports are popular recreational pursuits on the many lakes and reservoirs within the hydrographic unit.

The present (1960) population of the hydrographic unit is estimated to be 49,300. This is an increase of 22 percent over the 1950 population of 40,300. The distribution of the 1960 population by counties was: Placer County, 54 percent; Nevada County, 39 percent; and Sierra, Plumas and Yuba Counties, 7 percent. The present urban population of the unit is estimated to be 16,800.

Natural Features

Much of the terrain of the Yuba-Bear Rivers Hydrographic Unit is mountainous. Valley and foothill lands constitute only 5 percent and 35 percent, respectively, of the total area. The development of agricultural lands has been largely confined to those lands below an elevation of about 2,800 feet. There are, however, significant areas of wooded, less steeply sloping mountain lands at elevation above 5,000 feet which are suitable for recreational pursuits and mountain homes.

The hydrographic unit includes parts of two major geomorphic provinces of California. The westerly portion of the unit below about 500 feet in elevation is in the Great Valley geomorphic province, while the remaining portion of the unit lies in the Sierra Nevada geomorphic province. The parent rock materials in the Great Valley geomorphic province are divided into three units: flood plains, low alluvial plains and fans, and dissected alluvial uplands. The dissected alluvial uplands consist of gently rolling terrain merging with the Sierra Nevada foothills on the east. Cutting across all of these deposits are the stream deposits of the Yuba and Bear Rivers.

The Sierra Nevada geomorphic province is developed on a tilted block, the eastern margin of which has been uplifted along a series of faults. The western flank or dip slope of the great fault block slopes from 120 to 180 feet per mile toward the west, and finally passes beneath the alluvial fill of the Sacramento Valley. The parent rock materials in this province are metamorphosed sediments and volcanics of probable Carboniferous age, together with granitic rocks which intruded into the metamorphosed rocks in upper Jurassic time. The granitic rocks are well exposed throughout the area. Overlying the granites and metamorphics in many places are Tertiary auriferous gravels and volcanics.

The Yuba-Bear Rivers Hydrographic Unit can be divided into three major topographic zones for the purpose of distinguishing between soil characteristics: (1) the valley zone, (2) the upland zone, and (3) the mountainous zone.

The valley zone, consisting of lands below about 500 feet in elevation, comprises a narrow band along the westerly edge of the hydrographic unit extending from just west of Penryn to near Sheridan. The valley zone also includes the lands in the western portion of Beale Air Force Base. The upland zone comprises those lands between elevations of 500 and 2,500 feet, and extends easterly from the valley zone to a line which extends from just north of Colfax to Nevada City and to Challenge. The mountainous zone comprises the lands above the upland zone to the crest of the Sierra Nevada.

The soils in the unit differ widely as to their age, their mode of formation, their parent rock material, and their environmental modification. The soils in the valley zone are of Recent and older alluvial origin, formed from the outwash material of the many streams transecting the area, and are characteristically quite mixed as to their parent rock material. The surface of the Recent alluvials is very smooth, while that of the older hardpan is gently undulating. Much of the older alluvial fill-type soils have been dredged by gold dredges, with the resulting jumbled piles of loose water-polished rock which make these areas unsuitable for irrigation development. However, some of the dredger tailings areas have been leveled and top soil has been added to create irrigable soils. The Recent alluvial soils are characterized by coarse-textured soils having little or no agricultural development. In contrast to these, the older alluvial soils are fine-textured and are more agriculturally developed than

the older valley fill clay pans and hardpans. The uniformity of this alluvial belt is broken by an area of very shallow and rocky soils which exists along the easterly portion of the land between Roseville and Lincoln. In this area the soils, which are extremely rocky and generally have a depth of less than 1 foot, were formed over the remnant of an ancient tuffaceous volcanic mudflow, and for the most part are not suited for agricultural development.

In the upland zone the soils are primarily residual soils which were derived from basic igneous and metavolcanic parent rock material. Much of the irrigable land in the hydrographic unit that has been classified as being rocky (see Chapter IV) is located along the western portion of this zone.

The major soil bodies in the mountainous zone are restricted to the tops of several long, rather gently sloping finger-like ridges. In addition there are a few scattered parcels of Recent alluvial soils found in rather isolated valleys. Soils in the mountainous zone are deep, rather rocky, having a reddish-brown color, and are clay-loam in texture.

In addition to the three major zones, a small area between the valley and upland zones in the southern portion of the unit may be designated as an intermediate zone. This zone is located in the Loomis-Auburn area and extends from Folsom Lake in a northwesterly direction through Penryn to the Gold Hill region.

The intermediate zone contains primarily residual soils formed from a granitic parent rock material, with many large granitic outcroppings being well exposed throughout the zone. The soils are characterized by being rather sandy and pliable at the surface, gradually grading into clay-loam subsoils with depths of 3 to 4 feet, even in close proximity to rock outcroppings. The drainage of these soils depends almost entirely upon the surface slope. This condition leads to ponding in draws or depressions, while the sloping soils drain quite rapidly.

Climate

The climate of the Yuba-Bear Rivers Hydrographic Unit is characterized by long, dry summers and cool, rainy winters. About 90 percent of the precipitation occurs during the period from November through March. There is some summer thunder-shower activity at the higher elevations, but the total precipitation from these storms constitutes only about 3 percent of the seasonal total. At the higher elevations most of the precipitation occurs as snow, the average snowline elevation being 4,800 feet on April 1 of the average year. The general precipitation pattern in the unit increases from west to east with increasing elevation, to a maximum somewhat west of the crest of the Sierra Nevada.

The topographic zones used to describe soils are also helpful in describing the topographic features which influence the variation in precipitation. In the valley zone

such topographic features are confined almost entirely to changes in elevation. The average seasonal precipitation in this zone varies from 23 inches to 28 inches, with an overall average of about 26 inches. Other than changes in elevation, the first local orographic effects which cause variations in precipitation are noticed in the upland zone. In this zone some funneling of storms occurs in the steeper stream channels. The average seasonal precipitation is 46 inches, and the variation in average seasonal precipitation in the zone is from 24 inches at the lower elevations to 73 inches at the higher. The local orographic effects vary the greatest in the mountainous zone of the hydrographic unit. The average seasonal precipitation in this zone is 63 inches, with a variation in average seasonal precipitation of from 42 inches to 83 inches. Precipitation in the mountainous zone occurs both as rain and snow.

Several long-record precipitation stations are located within the unit. Table 2 shows the mean annual precipitation based on, or corrected to, the period 1905-55, and the corresponding elevation at selected stations.

*Mean period 1905-1955. "Mean period" is a period which is believed to represent conditions of water supply and climate over a long period of time.

Records indicate a wide variation of temperature within the Yuba-Bear Rivers Hydrographic Unit. The maximum recorded temperature is 118° F. and the minimum is -28° F. The mean annual temperatures in the hydrographic unit decrease somewhat with increasing elevation. The mean annual temperatures in the valley, upland, and mountainous zones are estimated to be 61°, 57°, and 49° F., respectively. Table 3 presents temperature data and corresponding elevations at selected stations in and near the Yuba-Bear Rivers Hydrographic Unit.

*Based on period from first year of record to 1959.

**Average for period 1924-1950.

***Average for period 1948-1958.

The frost-free period shown in Table 3 represents the average period, in days, between the last day in spring and the first day in fall when the daily minimum temperature fell below 32 degrees Fahrenheit.

Water Resources

Since the Yuba River heads near the crest of the Sierra Nevada, flow in the river is extended into the summer beyond the main precipitation period by melting of the high elevation snow-pack. Long-term records of runoff have been obtained for about 90 percent of the Yuba River drainage in the hydrographic unit

from the stream gaging stations "Yuba River near Smartville," for the period 1903 to 1941; and "Yuba River at Englebright Dam," and "Deer Creek near Smartville," combined, for the period 1941 to 1958. The Yuba River contributes an average of about 86 percent of the total runoff from the hydrographic unit.

The Bear River, with less than 1 percent of its drainage area above the 5,000-foot elevation where the snow-pack occurs, depends largely on storage water and imported water for its summer flow. Long-term records of the runoff from Bear River were determined by using the records of the stream gaging station "Bear River at Van Trent" for the period 1904-1927, and by adding the quantities of water diverted by the Camp Far West Irrigation District to recorded runoff at the station "Bear River near Wheatland" for the period 1929 to 1959. The Bear River contributes about 14 percent of the total runoff from the hydrographic unit.

Pertinent information synthesized from records of the two rivers are summarized in Tables 4 and 5 to indicate the general characteristics of runoff in the unit. The amounts reported are the measured runoff and do not include amounts diverted from the streams within the hydrographic unit.

TABLE 4

RECORDED RUNOFF
BEAR RIVER NEAR UNIT BOUNDARY

Period	Annual runoff		Discharge,
	in	in percent	cubic feet
	acre-feet	of average	per second
Average runoff for period of record, 1904-05 through 1957-58 less 1928 and 1929 years	338,700	100	--
Runoff in minimum year of record, 1923-24	23,100	7	--
Runoff in maximum year of record, 1906-07	725,400	214	--
Runoff in driest 6-month period of record, May through October 1924	2,940	--	--
Runoff in wettest 6-month period of record November 1906 through April 1907	672,200	--	--
Maximum recorded instantaneous flow, December 22, 1955	--	--	33,000
Runoff in the maximum month of record January 1909	295,500	--	--
Runoff in 1956-57 water year (Oct 1-Sept 30)	228,100	67	--
Runoff in 1957-58 water year (Oct 1-Sept 30)	497,900	147	--

TABLE 5

RECORDED RUNOFF
YUBA RIVER NEAR UNIT BOUNDARY

Period	Annual Runoff		Discharge,
	in	in percent	cubic feet
	acre-feet	of average	per second
Average runoff for period of record, 1903-04 through 1957-58	2,109,200	100	--
Runoff in minimum year of record, 1930-31	429,300	20	--
Runoff in maximum year of record, 1906-07	4,465,600	212	--
Runoff in driest 6-month period of record, June through November 1931	91,600	--	--
Runoff in wettest 6-month period of record, January through June 1907	2,875,900	--	--
Maximum recorded instantaneous flow, December 23, 1955	--	--	159,300
Runoff in maximum month, January 1909	1,415,800	--	--
Runoff in 1956-57 water year (October 1 through September 30)	1,544,100	73	--
Runoff in 1957-58 water year (October 1 through September 30)	3,015,100	143	--

It is of interest to note that, on the average, 84 percent of the runoff of the Yuba River occurs between January and June, and 85 percent of the Bear River runoff occurs between December and April. Runoff of the Yuba River in the maximum month exceeded the total annual flow in 16 of the 55 years of record. Similarly, runoff of the Bear River in the maximum month exceeded the total annual flow in 24 of the 52 years of record.

From June through October 1957, the critical period of use during which most of the diversions from this unit were measured, runoff from the Yuba River totaled approximately 90 percent of the long-term average for this 5-month period. During the month of May 1957, 398,780 acre-feet of runoff were recorded. This flow exceeded the flow in May during 32 of the 55 years of record. Similarly, runoff for the months of June through October 1957 exceeded the flow in the corresponding months in 28, 31, 48, 46, and 49 years, respectively, of the total 55 years of record.

Several of the diversions in the unit were measured during the period June through October 1958. During this period Yuba River runoff totaled approximately 160 percent of the long-term average for this 5-month period. Runoff recorded for the months May through October 1958 exceeded the flow in corresponding months in 51, 47, 42, 50, 52, and 43 years, respectively, of the 55 years of record.

Penstock to Spaulding
Powerhouse No.3 and
Lake Spaulding

Englebright
Reservoir

For the Bear River, somewhat lower flows occurred in 1957 with respect to the long-term average, while above average flows occurred during 1958. For 1957 the runoff totaled approximately 70 percent of the 52-year average, while for 1958 runoff totaled approximately 140 percent of the average.

Local Public Agencies Concerned with Water Development

Public agencies concerned with water development in the Yuba-Bear Rivers Hydrographic Unit include county water agencies, which are mainly planning and advisory agencies, irrigation districts, and urban water supply agencies.

The Nevada County Water Resources Committee, Placer County Water Agency, and Yuba County Water Agency represent the water development agencies of the counties within this hydrographic unit. These committees and agencies represent their respective county boards of supervisors. Their major duty is the development and coordination of water development projects.

There are two irrigation districts within the unit, Browns Valley Irrigation District and Nevada Irrigation District. The Nevada Irrigation District is contained entirely within the hydrographic unit, while a large part of the Browns Valley Irrigation District is outside the unit. Other public agencies which are designed to serve agricultural interests are San Juan Ridge County Water District, French Corral County Water District, and Yuba County Water District.

Urban water supply agencies within the unit include municipal water departments, local county water districts, a local public utility district, and a California Water District. Principal municipal water departments are located at Grass Valley, Nevada City, and Lincoln. County water districts serving municipal or domestic water supplies are located at La Porte and Alleghany. The local public utility district is the Downieville Public Utility District, serving the community of Downieville; and the California Water District is the La Porte Water District.

Agencies that are presently active in the development of water projects in the unit are Placer County Water Agency, Yuba County Water Agency, Nevada Irrigation District, Yuba County Water District, and Browns Valley Irrigation District. The Placer County Water Agency is presently in the advanced planning stages, with bonds having been approved by the voters, for the development of American River water for use in western Placer County on lands below approximately 400 feet in elevation. The Yuba County Water Agency is also in the advanced planning stages, with bonds having been approved by the voters, for the construction of New Bullards Bar Reservoir, which would inundate the present Bullards Bar Dam. Use of this water will be in the Sacramento Valley outside of the Yuba-Bear Rivers Hydrographic Unit. The Nevada Irrigation District has plans that have been approved by the voters for the development of additional storage facilities on the Middle and South Yuba Rivers above Milton and Bowman

Reservoirs; Rollins Reservoir on the Bear River; two powerhouses on the Bear River between Dutch Flat and Rollins Reservoir; and the enlargement of Scotts Flat Reservoir. The Yuba County Water District has preliminary plans for a reservoir at New York Flat on Dry Creek for service in the Dobbins area, and Browns Valley Irrigation District is now constructing a reservoir on Dry Creek near Virginia Ranch for additional supply to its service area.

Water facilities are also being developed by the Oroville-Wyandotte Irrigation District and South Sutter Water District for export from the hydrographic unit. Oroville-Wyandotte Irrigation District has completed construction on a reservoir and diversion facilities on Slate Creek for diversion to its water system in the Feather River watershed. South Sutter Water District is presently enlarging the dam on Bear River at Camp Far West Reservoir for additional storage and supply for its irrigation system, and for a more dependable supply for Camp Far West Irrigation District's irrigation system.

CHAPTER II. WATER USE

Present water requirements in the Yuba-Bear Rivers Hydrographic Unit are met almost entirely by diversions of surface runoff. For this investigation a survey was made of the systems established for the diversion of streamflow. Survey data reported herein include locations and descriptions of diversions, uses, amounts of water diverted, and information on apparent water rights relating to diversions. Diversions of water for all purposes are reported except those involving less than approximately 10 acre-feet per season, such as diversions by individual domestic users.

Quantities of water diverted were measured in order to further describe the diversion systems. The measured quantities do not necessarily represent average diversions, since in any single year the quantity will be influenced by precipitation and available streamflow during the growing season. As stated in Chapter I, runoff from the Yuba and Bear Rivers during the summer of 1957 was slightly below average, and during the summer of 1958 it was about one and one-half times the average. Considerations other than available water supply, such as economic factors, may also affect the relation of any diversion record to typical operating conditions. No attempt was made herein to assess these factors. The diversion quantities reported herein generally represent the actual amounts of water taken from the respective sources, and therefore include recoverable and irrecoverable losses incidental to the primary use.

The location of water wells and the measurement of their production were not covered in this investigation. However, the areas of lands irrigated by water from all sources were determined and are reported in Chapter III. Consumptive use of water was estimated in selected areas, and the results are presented later in this chapter.

The majority of the urban water service in the unit is supplied either by Pacific Gas and Electric Company or Nevada Irrigation District. Areas not receiving water from these suppliers are served by either small water service agencies, individual diversions of surface water, or individual water wells.

Urban areas receiving supplies from Pacific Gas and Electric Company and Nevada Irrigation District are in the following localities:

Pacific Gas and Electric Company

Washington	Washington Water Supply	Canyon Creek

-
- ^{1/} System leased and operated by French Corral County Water District.
- ^{2/} Serves only portion of city.

Water Rights

Water rights are an important consideration in the determination of availability of waters which are surplus to the present and future needs of an area wherein the waters originate. Data were therefore obtained with respect to apparent water rights in connection with the surface water diversions described herein. These rights may be based on appropriation or on riparian status, and may have been defined by adjudication proceedings. The California law of water rights, including both surface and underground water, is described briefly in Appendix C.

Most of the water use in the Yuba-Bear Rivers Hydrographic Unit is based on appropriative rights established since 1914. As of May 29, 1959, a total of 470 currently valid

applications had been made in the unit under the provisions of the Water Commission Act of 1914. Permits or licenses had been granted for 392 of these applications, 52 were pending with the State Water Rights Board, and 26 were incomplete as of that date. All the applications are tabulated in Appendix C, Table C-1.

Water rights are rights in property which, because of their often obscure establishment, are frequently the subject of controversy and litigation. In the Yuba-Bear Rivers Hydrographic Unit only one major suit has taken place and, as a result, six diversions reported herein divert under an adjudicated water right. This action is further described in Appendix C.

Surface Water Diversions

An attempt was made during the survey to locate and obtain data with respect to all diversions of more than 10 acre-feet per year. All diversions actually in use in 1957, plus those which had been used within the preceding five years, were included. The date of last use, if known, is recorded for such discontinued diversion. Direct diversions, as well as those involving significant surface storage, were located. All reservoirs which had surface areas of about three acres or more were mapped. Three acres is approximately the minimum area which can be determined with reasonable accuracy by the methods utilized. Reservoirs located along and operated in conjunction with canals and

ditches are shown on the land and water use maps, but are not considered as separate systems and are not assigned location numbers. Similarly, water supplies obtained from small intermittent streams intercepted by canal systems, which add to the primary diverted supply, are not classed as separate diversions.

In some situations water users have made efficient use of water by rediverting field runoff or spill collected from their own upstream diversion systems. In this investigation, such points of rediversion are neither located on the maps nor assigned numbers. If return flow from another water user's operation is rediverted, or if there is doubt as to the origin of the water, the diversion is delineated and assigned a number. Diversion systems of water companies or groups of water users are considered as single units; individual customer distribution points are not shown on the maps.

In situations where a water-serving agency sells water to an individual by releasing to a stream channel for rediversion below, the individual's diversion was considered as a separate diversion if water in addition to the purchased water was diverted. These diversions were measured and the amounts diverted are reported as either including or not including the water purchased from the water agency.

There were 374 diversions of surface water located in the unit in 1957. These are classified by primary use as follows:

<u>Primary use</u>	<u>Number of diversions</u>
Irrigation and/or stockwatering	275
Hydroelectric power production	42
Mining	15
Urban water supply	12
Recreation	11
Domestic	9
Industrial	7
Debris control	1
Export for irrigation outside of unit	<u>2</u>
Total	374

Many of these diversions have multiple uses but are listed under what is considered their primary use. For example, Nevada Irrigation District and Pacific Gas and Electric Company diversion systems delivering water to Lake Spaulding are all considered as power diversions, while their diversions further downstream are considered as being for irrigation, although most are used also for domestic, municipal, and mining purposes.

Points of diversion and main canals or pipelines used to convey water from them are delineated on the 23 sheets of Plate 2, entitled "Land and Water Use." Nevada Irrigation District diversions are generally shown on sheets 1 and 2 of Plate 4, entitled "Water Supply System of Nevada Irrigation District." Pacific Gas and Electric Company diversions are generally shown on sheets 1 and 2 of Plate 5, entitled "Power and Water Supply Systems of Pacific Gas and Electric Company."

Numbering System for Surface Water Diversions

Surface water diversions are numbered to indicate their approximate location by township, range, and section within the federal land survey system. In this report, each section is subdivided into 40-acre plots, and the diversions are numbered within each of these 40-acre plots according to the order in which they were located. This system is illustrated on Plate 2. For example, diversion 16N/8E-14C1, which is shown on sheet 16 of Plate 2 labeled as "14C1," is the first diversion located in the northeast quarter of the northwest quarter of Section 14 in Township 16 North, Range 8 East, Mt. Diablo Base and Meridian (MDB&M).

Descriptions of Surface Water Diversions

Descriptions, history, and other information relating to surface water diversions were obtained by field inspection, by interview with water users or their representatives, and by reference to prior reports and official records. This information is summarized in Table 6. Data in the table are arranged by diversion location number within each subunit.

The purpose of each diversion, the amount of water diverted during part or all of the years 1957 and 1958 where measurements or estimates were available, the extent of use in 1957, such as the number of acres irrigated, and the method of application of water are described in Table 6. If the purpose listed is not the usual use for that diversion, notation is made in the remarks column. The extent of domestic use is

Diversion 17/6E-4H1
diverting from
Dry Creek

Deer Creek
Reservoir and
intake of
D-S Canal

specified only when five or more connections are served. Stock-watering of less than 10 head of livestock is considered to be a domestic use. The extent of irrigation use is based on the land use survey described in Chapter III.

Detailed descriptions of the diversion systems, including dams, pumps, and main conduits, as well as any special features, are included in Table 6. The diversions are classified in the table as gravity, pump, and storage, according to the following descriptions:

Gravity diversion - A system in which water is taken from its natural course at a diversion structure and conveyed by gravity through a canal or pipeline to the area of use. Such a diversion may have a reservoir on the stream, but the capacity is small compared with the amount of water diverted, and provides no significant carryover storage from winter to summer.

Pump diversion - A system in which water is pumped from its natural course through a pipeline to the area of use or to a gravity conduit located at a higher elevation.

Storage diversion - A system consisting of or including a surface reservoir having significant carryover storage within each season or from season to season.

Systems not exclusively of one of these basic types are listed as combinations of those types which best describe them.

The type of water right under which the respective diversions are considered to be made is indicated in Table 6 as the "apparent water right." The determination of this item is based upon the best information available from the owner, from files of the State Water Rights Board, from court decrees and other official records, or from other sources.

DESCRIPTION OF SURFACE WATER DIVERSIONS IN
YUBA-BEAR RIVERS HYDROGRAPHIC UNIT

Location number and owner Plate 2 sheet number	Diversion name and/or owner	Source	Water use in 1957			Apparent water right			Indicated date of appropriation or first use	Description of diversion system	Remarks
			Purpose	Extent and method of use	Amount diverted in acre-feet	Type	Amount	Reference			
Deer Creek Subunit (Continued)											
16N/7E-20N1 (Sheet 16)	Albert J. Nimsingale	Triunfery to Squirrel Creek	Irrig. Stock.	9 acres by sprinkler 30 head	Not meas.	Approp.	0.45 cfs	A-16026 ^a	1957	Pump; 7-hp gasoline engine with 400 feet of 4-inch pipe and 300 feet of 2-inch pipe.	
16N/7E-20N1 (Sheet 15)	Union Ditch J. C. Peacock	Squirrel Creek	Irrig. Stock.	69 acres by flooding and sprinkler ^a 90 head	1,107 ^a	Riparian	--	--	Prior 1920	Gravity; concrete and rock dam 16 feet high, 30 feet long, with 2.2 miles of earth ditch.	Former owners: Herbert J. Mile, Mortimer. Area irrigated received surplus water from Nevada Irrigation District. Reported amount diverted for 4/12/57 - 12/31/57 only.
16N/7E-20N1 (Sheet 15)	E. S. Hass	Squirrel Creek	Irrig.	3 acres by sprinkler	Not meas.	Riparian	--	--	Prior 1957	Pump; 2-hp gasoline engine with 1.5-inch pipeline.	Former owners: Thomas E. Dow, McMill, Peterson.
16N/7E-15N1 (Sheet 15)	Carl Niesen	Grubb Creek	Irrig. Stock.	34 acres by flooding ^a --	Not meas.	Riparian	--	Deed	About 1892	Gravity; wood dam 5 feet high, 30 feet long, with two earth ditches having a total length of 0.4 mile.	Former owners: Jesse Ennor, Jesse Ennor. Area irrigated received surplus water purchased from Nevada Irrigation District.
16N/7E-15N1 (Sheet 15)	Ralph J. and Lois Winslow	Squirrel Creek	Irrig.	(s)	None	Riparian	--	Deed	About 1857	Gravity; small earth dam with 0.4 mile of earth ditch.	Former owners: Jesse Ennor, Jesse Ennor. Irrigated by water from water jointly with 16N/7E-15N2 until 1956.
16N/7E-15N2 (Sheet 15)	Ralph J. and Lois Winslow	Grubb Creek	Irrig. ^a	(s)	None	Riparian	--	Deed	About 1892	Gravity; small earth dam with 50 feet of wood flume to ditch from 16N/7E-15N1.	Former owners: Jesse Ennor, Jesse Ennor. Irrigated by water from water jointly with 16N/7E-15N1 until 1956.
16N/8E-20N1 (Sheet 16)	Madison Ditch Nevada Irrigation District	Deer Creek ^a	Irrig. Stock. Domestic	(1)	4,701	Approp.	(s)	A-1615 ^a	1851	Gravity; concrete dam 2 feet high, 120 feet long, with 19.0 miles of earth ditch and wood flume.	Former owner: Excelsior Water and Mining Company. Stream flow of Deer Creek augmented by 16N/9E-28N and 17N/12E-20N2 (Donner Pass Subunit). See 16N/7E-20N1 for water right amount.
16N/8E-20N1 (Sheet 16)	Leland H. Brown	Deer Creek	Irrig. Stock. Mining	16 acres by flooding 30 head Flume line	Not meas.	Riparian	--	Deed	Prior 1900	Gravity; small rock and gravel dam with 7.8 miles of earth ditch.	Former owners: William Brown, Jerry W. Brown.
16N/8E-20N2 (Sheet 16)	Tunnel Ditch Nevada Irrigation District	Deer Creek ^a	Irrig. Stock. Domestic	(1)	5,157 ^a (6,413) ^a	Approp.	(s)	A-1615 ^a	1892	Gravity; concrete dam 8 feet high, 30 feet long, with 1.0 miles of earth ditch and tunnel.	Former owners: Excelsior Water and Mining Company. Stream flow of Deer Creek augmented by 16N/9E-28N and 17N/12E-20N2 (Donner Pass Subunit). Reported amount diverted for 1957 is for April - December only. Amount shown in parentheses is total for 1957. See 16N/7E-20N1 for water right amount.
16N/9E-20N1 (Sheet 16)	Edwin A. Beutler	Spring to Dry to Deer Creek	Irrig. Domestic	11 acres by flooding (c)	Not meas.	Riparian	--	--	Prior 1900	Gravity; 75 feet of 6-inch pipe and 0.2 mile of earth ditch.	Former owners: Frank Serly, Peterson.
16N/9E-20N1 (Sheet 16)	Clifford G. Thorson	Slate Creek	Irrig. Stock.	11 acres by flooding 30 head	Not meas.	Riparian	--	Deed	Prior 1920	Gravity; small earth dam with 0.4 miles of earth ditch.	Former owners: David, Hall.

^a See remarks.

* - See remarks.

** - For additional information see Appendix D, "Detailed Descriptions of Certain Surface Water Diversions".

-- - Information not available.

a - Refers to applications to appropriate water filed with the State Water Rights Board.

For additional information see Table C-1.

e - Placer County Records of Water Rights.

f - Account for water purchased water.

h - Nevada County Records.

i - Sierra County Records.

j - Sierra v. Nevada Irrigation District, No. 5566, Nevada County Superior Court, October 8, 1932. For additional information concerning this case, see Appendix C.

The actual amount of the right, if established and known, and a reference to the source of data are also included. Although this information is believed to be accurate, it is emphasized that it is not based on sworn claims or testimony and should in no way be construed to represent a conclusive determination of water rights.

Diversions for which the apparent water rights are based on adjudication are listed as "adjudicated," and those based on appropriative rights are listed as "appropriative." Those which have been neither adjudicated nor based on appropriation, but for which the area of use is apparently riparian to the stream or the owner claims such, are listed as "riparian." Diversions listed as adjudicated or appropriative may also be riparian, although no attempt was made in such cases to determine the riparian status.

In the case of an adjudicated right, the amount of the decreed right is tabulated. For an appropriative right, the amount tabulated is that found in the filing, if any, or in the application, or in the latest permit or license which may have been issued in connection with the application. The reference given for an appropriation initiated after the effective date of the Water Commission Act (1914) is the number of the application on file with the State Water Rights Board. For appropriations prior to 1914, the reference, if known, is the book and page number of the official county record in which the filing is recorded. Such filings were made in accordance

with Sections 1410 and 1422 of the Civil Code, as enacted in 1872, which preserved the priority of a diligent appropriator from the time of filing and enabled him to prevail over a concurrent nonstatutory appropriator. When a mention of the water right is made in the patent or deed of the property, and if no other reference is known, either "patent" or "deed" is given as a reference.

Detailed information with respect to diversions which could not be adequately presented in Table 6 is included in Appendix D. The information relates to diversions by Browns Valley Irrigation District, Nevada Irrigation District, and Pacific Gas and Electric Company.

Records of Surface Water Diversions

Continuous or periodic measurements of surface water diversions were made by the Department of Water Resources during part or all of the years 1957 and 1958 whenever it was feasible to measure the flows. Most of the diversions for nonagricultural uses and some of those used for agriculture are operated throughout each year. Substantially all diversion measurements were started in March or April of 1957, prior to the commencement of intensive irrigation, and the measurements were continued through the irrigation season. Measurements of the year-round diversions were continued into 1958 to obtain a

complete year of record, and diversions for which measurements were not started until late in 1957 were measured through 1958. A few diversions were located at a late stage in the survey, and no measurements or estimates of these were attempted. Results of the measurement program are summarized in five tables. Table 7 presents monthly records of surface water diversions of individual diverters; Table 8 presents monthly records of surface water diversions by Nevada Irrigation District; Table 9 presents monthly records of surface water diversions by Pacific Gas and Electric Company; Table 10 presents monthly records of surface water imports and exports; and Table 11 presents monthly records of miscellaneous streamflows required for computing consumptive use. Measurements of each diversion were made at a location above the area of first use and as close to the diversion intake as possible, but below any regulatory spill. Exceptions are noted in the tables.

Determinations of diverted quantities were made primarily by measurement of open channel flow and by testing of pumps. Periodic current meter measurements of open channel flow were made during the diversion season to obtain channel ratings. The water surface stage was recorded either by weekly observations of a staff gage or with a continuous water stage recorder, from which quantities of flow were calculated. Existing weirs were used whenever available. These observations were supplemented by interview of water users to obtain additional staff gage readings

and to obtain data on possible abrupt changes in operations between readings. On some diversions, where measurements were normally made by the diverter, the records were obtained from the diverter.

The values in Tables 7 through 11 are based on various methods listed in the column entitled, "Method of observation and calculation." When the monthly data were sufficiently reliable, monthly values are shown. When the diversion for a given period is known to have been zero, it is so indicated. The data, however, were sometimes not sufficiently detailed to justify a breakdown into monthly values. When data were incomplete or uncertain, they are designated as estimates. Notations regarding the extent of irrigation period indicate the overall period of irrigation, but not necessarily that daily or continuous irrigation was practiced through the period. Notations that a stream source was "dry" at a certain time indicate that streamflow was so low as to make diversion infeasible.

Index to Surface Water Diversions

For convenience of the reader, an alphabetical index of diversion owners and diversion names, along with the subunit location of each diversion and reference to map and page numbers on which data concerning each appears, is shown on Table 15 at the end of this chapter.

Imports and Exports

Imports

Imports of surface water to the unit consist of five diversions from adjacent watersheds for use in the Yuba-Bear Rivers Hydrographic Unit. They are Lake Valley Canal, Pulp Mill Canal, and Towle Canal, all owned by Pacific Gas and Electric Company and diverting from the American River watershed; and Bean Ditch and Oroville-Wyandotte Canal, diverting from the Feather River watershed.

Lake Valley Canal diverts from the North Fork of North Fork American River to supplement the Drum Canal, while the Pulp Mill Canal and the Towle Canal divert from Canyon Creek, which is a tributary to the North Fork American River, to supplement the Boardman Canal.

Bean Ditch diverts from Sly Creek for irrigation of 80 acres and for supply to the community of Strawberry Valley.

Oroville-Wyandotte Irrigation District's Oroville-Wyandotte Canal diverts from Lost Creek and passes through the Yuba-Bear Rivers Hydrographic Unit, but its primary use is in the Feather River watershed. The only service from the ditch in the unit is to the Sacramento Box and Lumber Company mill at Woodleaf.

Exports

Five diversions in the Yuba-Bear Rivers Hydrographic Unit divert water from the unit for uses in the American River and Feather River watersheds and the Sacramento Valley floor.

Pacific Gas and Electric Company's Boardman and Bear River Canals export portions of their supplies to the American River watershed and the Sacramento Valley floor for irrigation, domestic, and municipal uses, and the excess is released to Folsom Reservoir on the American River. The areas served by these diversions outside the unit extend along the southern hydrographic unit boundary from the Dutch Flat area to Roseville. The primary area irrigated is in the American River watershed to the south of Auburn. That portion of the City of Roseville outside of the Yuba-Bear Rivers Hydrographic Unit is the principal municipal service area outside the unit. The amount exported by these diversions in 1958 was about 174,300 acre-feet, of which a large portion was spilled to Folsom Reservoir.

Camp Far West Reservoir stores water on the Bear River for supply to Camp Far West Irrigation District on the Sacramento Valley floor.

Diversion 17N/6E-4H1, owned by Frank Carmichael, diverts water from Dry Creek for use in the Feather River watershed, on the Sacramento Valley floor, and in the Yuba-Bear Rivers Hydrographic Unit. During the irrigation season April through October, water is exported to the Feather River and Sacramento Valley areas for irrigation purposes. During

the period November through March, water is released from the diversion to Tennessee Creek in the Feather River area from which it is delivered to the Browns Valley Irrigation District by rediversion to the Browns Valley Ditch. Part of this water is used in the hydrographic unit and the remainder is exported to the Sacramento Valley floor. The water delivered to the district is in exchange for water supplied by the district to Frank Carmichael for use on the Sacramento Valley floor during the irrigation season.

Browns Valley Ditch serves areas in the Feather River watershed and the Sacramento Valley floor within the Browns Valley Irrigation District principally for irrigation, domestic uses, and stockwatering. Of the 20,036 acre-feet of water diverted during the period of measurement in 1957, 4,882 acre-feet were exported.

In years when surplus water is available to Nevada Irrigation District in Placer County, portions of such water are released down Auburn Ravine for sale to users on the Sacramento Valley floor. A total of 11,220 acre-feet of such water was sold in 1958.

For records of measured quantities of water exported to other hydrographic units, or imported to the unit, see Table 10. Locations of points of import and export are designated on Plate 2.

Consumptive Use

Consumptive use is defined as the quantity of water transpired by plants, retained in plant tissue, and evaporated from the plants and surrounding land and water surfaces. This also includes water similarly consumed by urban and nonvegetative types of land use. In the Yuba-Bear Rivers Hydrographic Unit, the largest quantity of water diverted from surface streams is utilized for the production of hydroelectric power, but by far the largest consumptive use of water is by irrigated agriculture. Often the consumptive use of electric power generation is negligible, but, in this unit, evaporation from the large storage reservoirs and extensive canal systems used jointly for power generation and irrigation is significant. In this bulletin, however, no attempt was made to determine consumptive use of water for uses other than those associated with vegetated areas.

The total annual consumptive use of applied water for irrigation in the Yuba-Bear Rivers Hydrographic Unit is estimated to have been 81,000 acre-feet in 1957 and 1958. This is estimated from the cropping pattern, which was assumed to be the same in 1958 as was surveyed in 1957, and the unit crop consumptive use of applied water values published in State Water Resources Board Bulletin No. 2.

A consumptive use study was conducted in the hydrographic unit to determine the relationship of consumptive use of applied irrigation water to depletion of water supply. This study is described in the following paragraphs.

Consumptive Use Study

The availability of recorded diversion measurements and the hydrologic characteristics of the foothill lands in the Yuba-Bear Rivers Hydrographic Unit offered an unusual opportunity to directly determine the consumptive use of applied water plus incidental consumptive losses, or total depletion of water supply, in several areas. The determination of this total in each of three areas comprised a consumptive use study conducted in 1958. In each study area the total water consumed by the irrigated crops and by other consumptive losses which occurred in the process of delivering water to primary users, concentrating return flows, and rediverting water to secondary users was considered to be equal to the difference between measured inflow and outflow from each area during the period of measurement. A prime factor which made such determinations possible is that there is little or no ground water storage or usage in the foothill areas of the unit. The information resulting from this study will be of value when estimating future water requirements for this and similar foothill areas.

Three predominantly agricultural areas within the unit were chosen for the consumptive use study. These areas, as depicted on Plate 6 entitled "Consumptive Use Study Areas, Yuba-Bear Rivers Hydrographic Unit", are Auburn Ravine-Coon Creek Study Area, Rocklin Study Area, and Squirrel Creek Study Area. In each area water is imported by canals and distributed to the water users, and return flow to natural stream channels is rediverted at several locations for re-use. In the case of the Auburn Ravine-Coon Creek and Rocklin Study Areas, some water is transported through the areas

without use for irrigation. In the summer months streams within the areas are sustained entirely by imported water. Water entering and leaving each area was measured in 1958. By subtracting the outflow from the inflow for each area the portion of water entering the area which was consumed within the area was determined.

Flow measurements were made during the principal irrigation period, June through September, for each area except the Auburn Ravine-Coon Creek Study Area where no measurements were made in September. Results of the measurements are shown in Tables 12, 13, and 14.

The total June through September consumptive use of applied water by irrigated crops within each of the three study areas was estimated. These estimates were made by reducing seasonal unit crop consumptive use of applied water values that were published in State Water Resources Board Bulletin No. 2 by 19 percent to account for the partial season period of analysis. The value of 19 percent was determined by utilizing monthly atmometer measurements of evaporation obtained in the area in 1958. The estimated value of consumptive use of applied water by crops is compared with the measured values of total depletion in each area in the following paragraphs. On the average, in the three study areas 63 percent of the total depletion was accounted for by the consumptive use of water by crops. This comparison is an indication of incidental losses that may be incurred in irrigation developments in foothill areas having cultural and irrigation practices similar to those in the areas considered in this study.

Descriptions of the three study areas and calculations of consumptive use are presented in the following paragraphs.

Auburn Ravine-Coon Creek Study Area. Auburn Ravine-

Coon Creek Study Area, which comprises the Auburn Ravine and Coon Creek Subunits, has an area of approximately 78,100 acres. These lands range from valley lands north of Lincoln, at an elevation of about 100 feet, to steeply sloping lands near Applegate, at elevations up to 2,100 feet.

The water consumed in this area during the period June through August 1958 was determined from measurements to be 33,200 acre-feet as shown in Table 12. It was estimated, from amounts consumed in the other study areas and from the 1958 atmometer data, that an additional 10,400 acre-feet of water was consumed in September 1958. Thus, the supply to the area was depleted by an estimated 43,600 acre-feet of water during the period June through September.

The area under irrigation within the study area was approximately 17,830 acres. The total June through September 1958 estimated consumptive use of applied water by crops on this acreage was 27,400 acre-feet. The crop distribution and the estimated consumptive use by individual crops within the area are tabulated below:

<u>Crop</u>	<u>Area in acres</u>	<u>Estimated consumptive use of applied water by crops June through September 1958</u>	
		<u>Unit value :</u> <u>in feet :</u>	<u>Total</u> <u>in acre-feet</u>
Pasture	11,000	1.8	19,800
Orchard	6,470	1.1	7,100
Hay (alfalfa)	140	1.8	300
Truck, berry, and grain	120	0.6	100
Field	<u>100</u>	0.8	<u>100</u>
	17,830		27,400

The ratio of the quantity of consumptive use of applied water by crops (27,400 acre-feet) to the total depletion (43,600 acre-feet) indicates that about 63 percent of the total water depleted is consumed by the irrigated crops.

Rocklin Study Area. Rocklin Study Area, with the same boundaries as Rocklin Subunit, has a total area of about 36,700 acres consisting primarily of rolling foothills. As shown in Table 13, approximately 21,400 acre-feet of the water supplied to this area during the period June through September 1958 was depleted. The irrigated area which received water was about 11,070 acres. The total June through September 1958 estimated consumptive use of applied water by crops on this acreage was 13,700 acre-feet. The estimated consumptive use by the individual crops, and the crop distribution within the area are tabulated below:

<u>Crop</u>	<u>Area in acres</u>	<u>Estimated consumptive use of applied water by crops June through September 1958</u>	
		<u>Unit value :</u> <u>in feet :</u>	<u>Total</u> <u>in acre-feet</u>
Pasture	2,030	1.8	3,700
Orchard	8,820	1.1	9,700
Hay (alfalfa)	90	1.8	200
Truck and berry	60	0.6	40
Field	<u>70</u>	0.8	<u>60</u>
	11,070		13,700

The ratio of the quantity of consumptive use of applied water by crops (13,700 acre-feet) to the total depletion (21,400 acre-feet) indicates that about 64 percent of the total water depleted is consumed by the irrigated crops.

Squirrel Creek Study Area. The Squirrel Creek Study Area contains a portion of the Squirrel Creek drainage located west of Grass Valley. The topography within this area is primarily of a rolling foothill nature, but the area contains some steeply sloping lands.

As shown in Table 14, the supply to the area for the period June through September 1958 was depleted by approximately 4,000 acre-feet. The area under irrigation within the study area was approximately 1,400 acres, which consisted almost entirely of pasture lands.

The estimated June through September 1958 consumptive use of applied water by crops on the 1,400 acres of land is 1.8 acre-feet per acre or 2,500 acre-feet. The ratio of this quantity to the total depletion (4,000 acre-feet) indicates that about 63 percent of the total water depleted is consumed by the irrigated crops.

CHAPTER III. LAND USE

The results of a survey of water uses and water facilities in the Yuba-Bear Rivers Hydrographic Unit were presented in Chapter II. In this chapter are reported the results of a survey of present land uses as related to water use. Also included is a brief summary of historical conditions. A thorough knowledge of the nature and extent of land and water uses under existing conditions within this hydrographic unit is one of the primary requisites in evaluating future water requirements within the unit.

Historical Land Use

As previously noted, the early development of the Yuba-Bear Rivers Hydrographic Unit paralleled closely the mining of gold, and many miners who failed turned to farming for their living. The majority of the lands under cultivation in the early years were producing fruit which started with the experimental planting of peach and almond seeds in 1846 along the Bear River flood plain, and soon extended to the nearby foothills. In addition to these orchards, extensive brush and timberlands were cleared for the production of barley, wheat, oats, and other crops. Although mining decreased after 1852, agricultural lands steadily increased until 1880 when the mines in Nevada County closed. Very little agricultural activity took place from this time until during and after World War I when, with an increased demand

agricultural lands expanded and irrigation facilities improved. According to U. S. Census records, the irrigated area in Placer County, to which nearly all water was supplied by Pacific Gas and Electric Company, increased from 16,845 acres in 1910 to 27,520 acres in 1920.

In Nevada County a rapid expansion of agriculture took place with the development of Nevada Irrigation District in the 1920's and 1930's. In 1929, the former Division of Engineering and Irrigation reported in its first issue of Bulletin No. 21, "Irrigation Districts in California," that 11,704 acres were then irrigated within the Nevada Irrigation District and that only about one-third of the Nevada County portion of the district's distribution system was complete, and none of the Placer County portion was complete. Also reported was that one-third of the area irrigated in Nevada County was devoted to orchard crops and the remaining two-thirds was producing forage crops, while in Placer County practically all of the irrigated lands were in orchard. At that time, 32,000 acres in Nevada County and a large percentage of the area in Placer County had been cleared to receive water from the district. Lands adjoining the communities of Nevada City and Auburn were prominent in this agricultural development.

During the depression years of the 1930's, agricultural development again declined, with the possible exception of orchards. Since that time irrigated agriculture and the raising of livestock has increased.

Present Land Use

A detailed survey of land uses in the Yuba-Bear Rivers Hydrographic Unit was conducted during the spring of 1957 as part of this investigation. The land uses mapped in this survey as related to water use fall into four major categories: irrigated lands, dry-farmed lands, urban lands, and recreational lands; and one minor category: naturally high water table lands, such as natural meadowlands. Lands not falling into any of these five categories were mapped as native vegetation. The various types of land uses mapped in 1957 are delineated on sheets 1 through 23 of Plate 2. The acreages of land uses within each subunit are presented in Table 16. The values represent gross acreages, including nonwater service areas such as roads, ditches, buildings, and storage areas and miscellaneous rights-of-way which occur within the mapped areas.

At the time of the survey, Beale Air Force Base was relatively inactive, and most of the facilities were unused. The developed areas were shown neither as urban nor military areas. Irrigated lands within the boundaries of the base were delineated as such.

Methods and Procedures

The land use survey and the location of surface water diversions were accomplished by relating field observations to aerial photographs having a scale of about 1:20,000. Stereoscopes were used to assist in the field mapping procedure.

As each point of diversion was located, it was plotted on the aerial photographs, and as the use of each parcel of land was determined, it was delineated on the aerial photograph. The hydrographic unit was traversed by automobile as completely as roads and terrain permitted. When necessary because of poor accessibility, inspections were made on foot. An example of an aerial photograph with land use data delineated on it is shown on page 141.

After completion of the field mapping, the data delineated on the photographs were transferred to copies of U. S. Geological Survey quadrangle maps reproduced at a scale of 1:24,000. This procedure was necessary to bring the delineated areas to a common scale for accurate determination of acreages, since the scale of the aerial photographs utilized varied widely. A series of these maps, showing the location of all diversions and the fields associated with each irrigation diversion, was reviewed by local representatives. These work maps were then used in the preparation of Plate 2.

Prints of these maps were used in computing the acreages of the land uses. Each delineated area on these maps was manually cut out and was carefully weighed on an analytical balance. The weights were converted to acreages, using ratios determined for each map. This method has proven to be an expeditious and accurate means of area determination where a large number of small parcels is involved.

Irrigated Lands

Irrigated lands, as designated in this report, include all agricultural lands which receive water artificially applied. Acreages of irrigated lands are reported in Table 17 by surface water diversion, by subunit, and by crop. Although the irrigated lands are tabulated under the name of the subunit within which the lands are located, it should be noted that the diversion serving the lands may originate in another subunit and that a given diversion may serve lands in more than one subunit. It was not possible to determine the areas of lands served by each diversion in the Nevada Irrigation District system, because of the intermingling of waters from the several diversions. Within each subunit all lands served by the district are combined in a single line entry in Table 17. The lands served by Pacific Gas and Electric Company were similarly treated.

The irrigated lands are segregated in Table 17 into grain and hay crops, field crops, pasture, truck and berry crops, orchard, vineyard, and idle irrigated lands. Hay crops in the area consist entirely of alfalfa. Pasture was further subdivided into mixed, native, and meadow pasture, the latter comprising native pasture lands having a high water table induced by application of irrigation water. Orchard crops are subdivided into deciduous and subtropical. Deciduous orchards are still further subdivided into apples, peaches, pears, plums, mixed and miscellaneous fruits, and miscellaneous nuts.

Irrigated pasture
west of
Grass Valley

Cattle grazing
south of
Grass Valley

Idle irrigated lands are those lands which were not irrigated in the year of survey but which had been irrigated within the preceding three years. Fallow irrigated lands are those cultivated lands which may have been irrigated during the year of survey, but which at the time of survey were only tilled and not planted to a crop.

The irrigated lands were identified on the work maps by diversion service area, by type of service received in the year of survey, and by crop irrigated, but on Plate 2 they are grouped into three categories: (1) those lands which received a full irrigation during the year of survey, (2) those lands which received only a partial irrigation because of insufficient water supply, and (3) those lands usually irrigated but which were idle or fallow in 1957. The limited acreage irrigated by ground water is included in Table 17 and delineated on Plate 2.

Naturally High Water Table Lands

In addition to the lands which receive applied water as described above, there are lands supporting vegetation which utilize water from a naturally high water table, such as mountain meadows or lands adjacent to lakes and streams. These are shown on Plate 2 as "naturally irrigated meadowlands" and "marshes and swamps."

Dry-farmed Lands

Dry-farmed lands are those lands normally planted to a crop but which do not receive applied water. These include all lands so farmed, whether or not a crop is produced in the

year of survey. Dry-farmed lands are called "idle" if entirely uncultivated in the year of survey and "fallow" if tilled but without a crop. Lands which had been idle for more than three years and appeared to have reverted to "native vegetation" were so mapped.

It should be noted that the term "dry-farmed" as used herein refers to the farming practice on these lands, and not to a lack of soil moisture.

Since noncultivated rangelands are usually indistinguishable from lands with native cover not used for grazing purposes, both types are included in native vegetation. Water use in both cases is essentially the same, and is dependent upon precipitation.

Urban Lands

Urban lands include the total areas of cities, towns, small communities, and industrial plots which are large enough to be delineated. Also included are parks, golf courses, race tracks and cemeteries within or near urban areas. The acreages represent gross delineations, including streets and vacant lots, and are therefore not necessarily fully developed at the present time. In this survey the boundaries of urban communities were delineated to include all lands with a density of one house or more per two acres.

Recreational Lands

Recreational lands were mapped on aerial photographs in the field in four categories: (1) residential, (2) commercial,

(3) camp and trailer sites, and (4) parks. Recreational residential lands include permanent and summer home tracts within a primarily recreational area. The estimated density of homes per acre was also indicated. Recreational commercial lands include those containing motels, resorts, hotels, stores, restaurants, and similar commercial establishments in primarily recreational areas. Lands mapped in the camp and trailer sites category include those areas so used within primarily recreational areas outside the boundaries of parks. The entire areas within the boundaries of parks are included without regard to the extent of development within them. Obviously, nearly all of the mountainous and water surface areas are suitable for some recreational use such as fishing, hunting, hiking, and picnicking; however, for the purpose of this land use survey, consideration is given only to those lands having some intensive development requiring water service. The recreational lands are combined into one group in Table 16 and on Plate 2.

Native Vegetation

Lands which are essentially in a native state and not included in any of the above categories are mapped as native vegetation. Native vegetation totals some 1,187,000 acres, or 95 percent of the Yuba-Bear Rivers Hydrographic Unit. Included in this area are water surfaces, scattered residences, farm buildings, storage areas, and other uses covering a few acres or less which are too small to be mapped separately. These lands are used to a great extent for mining, commercial timber production, livestock range, and/or recreational activities such as fishing, hunting, hiking and picnicking.

CHAPTER IV. LAND CLASSIFICATION

Calculations of future water requirements will be based in a large part on a classification of lands with regard to their potential for irrigated agricultural and recreational development. The results of a land classification survey conducted to determine this potential in the Yuba-Bear Rivers Hydrographic Unit are presented in this chapter.

Lands were not classified in this survey with respect to their potential for urban development. The use of lands for urban purposes is closely related to population at any given time, and it is planned to defer designation of these lands until estimates of population and related economic studies are made in connection with determination of future water requirements.

The former Division of Water Resources made a reconnaissance classification of lands of the State which was reported in State Water Resources Board Bulletin No. 2, "Water Utilization and Requirements of California," dated June 1955. A similar reconnaissance classification, but with more detail, was also reported in the Division of Water Resources Bulletin No. 56, "Survey of Mountainous Areas," dated December 1955, and the former State Water Resources Board's Bulletin No. 10, "Placer County Investigation," dated June 1955. Bulletin No. 10 entailed only that portion of the Yuba-Bear Rivers Hydrographic Unit in Placer County. A still more detailed land classification survey was reported in Department of Water Resources

Bulletin No. 58, "Northeastern Counties Investigation," dated June 1960, covering that portion of the Yuba-Bear Rivers Hydrographic Unit in Yuba, Plumas, Butte, and Sierra Counties. The present investigation uses the same basic land classification standards which were used in Bulletin No. 58. However, additional classes of recreational lands have been included along with some minor modifications to the irrigable agricultural land standards. In Yuba, Plumas, Butte, and Sierra Counties, where the land classification survey was already completed for Bulletin No. 58, the basic classification reported therein was modified to meet the standards for this investigation, along with a remapping of the present urban lands.

The lands within Beale Air Force Base were classified as to their potential for irrigated agriculture, regardless of their present military status.

Results of the land classification survey are shown on sheets 1 through 23 of Plate 3, "Classification of Lands." The totals of areas in each classification are shown in Table 19.

Methods and Procedures

The general methods and procedures used in field mapping and tabulation of information were essentially the same as those described for the land use survey in Chapter III. An example of land classification delineations on an aerial photograph is shown on page 163.

The standards used in the classification of lands are given in detail in Table 18.

Example of Land Classification Delineated on Aerial Photograph
(See page 164 for symbol explanation)

TABLE 18
LAND CLASSIFICATION STANDARDS

Land class: symbols :	Characteristics
<u>Irrigable Lands</u>	
V -	These lands are level or slightly sloping and vary from smooth to hummocky or gently undulating relief. The maximum allowable slope is 6 percent for smooth, reasonably large-sized bodies lying in the same plane. As the relief increases and becomes more complex, lesser slopes are limiting. The soils have medium to deep effective root zones, are permeable throughout, and free of salinity, alkalinity, rock, or other conditions limiting crop adaptability of the land. These lands are suitable for all climatically adapted crops.
H -	These are lands with greater slope and/or relief than those of the V class. They vary from smooth to moderately rolling or undulating relief. The maximum allowable slope is 20 percent for smooth, reasonably large-sized bodies lying in the same plane. As the relief increases and becomes more complex, lesser slopes are limiting. The soils are permeable, with medium to deep effective root zones, and are suitable for the production of all climatically adapted crops. The only limitation is that imposed by topographic conditions.
M -	These are lands with greater slope and/or relief than those of the H Class. They vary from smooth to steeply rolling or undulating relief. The maximum allowable slope is 30 percent for smooth, reasonably large-sized bodies lying in the same plane. As the relief increases and becomes more complex, lesser slopes are limiting. The soils are permeable, with medium to deep effective root zones, and are suitable for the production of all climatically adapted crops. The only limitation is that imposed by topographic conditions.

Any variation in the foregoing, as defined, is indicated by use of one or more of the following symbols:

- W - Indicates the presence of a high water table, which in effect limits the present crop adaptability of these lands to pasture crops. Drainage and a change in irrigation practice would be required to affect the crop adaptability.

TABLE 18 (Continued)

LAND CLASSIFICATION STANDARDS

Land class:	
symbol :	Characteristics
s -	Indicates the presence of an excess of soluble salts or exchangeable sodium in slight amounts, which limits the present adaptability of these lands to crops tolerant to such conditions. The presence of salts within the soil generally indicates poor drainage and a medium to high water table. Reclamation of these lands will involve drainage and the application of small amounts of amendments and some additional water over and above crop requirements in order to leach out the harmful salts.
ss -	Indicates the presence of an excess of soluble salts or exchangeable sodium in sufficient quantity to require the application of moderate amounts of amendments and some additional water over and above crop requirements in order to effect reclamation.
h -	Indicates very heavy textures, which make these lands best suited for production of shallow-rooted crops.
l -	Indicates fairly coarse textures and low moisture-holding capacities, which in general make these lands unsuited for the production of shallow-rooted crops because of the frequency of irrigations required to supply the water needs of such crops.
p -	Indicates shallow depth of the effective root zone, which limits use of these lands to shallow-rooted crops.
r -	Indicates the presence of rock on the surface or within the plow zone in sufficient quantity to prevent use of the land for cultivated crops.

Urban Lands

- UD - The total area of cities, towns, and small communities presently used for residential, commercial, recreational and industrial purposes.

Recreational Lands

- RR - Existing and potential permanent and summer home tracts within a primarily recreational area. The estimated number of houses, under conditions of full development, is indicated by a number in the symbol, i.e., RR-3 is suitable for three houses per acre.

TABLE 18 (Continued)
LAND CLASSIFICATION STANDARDS

Land class: symbols :	Characteristics
RC -	Existing and potential commercial areas which occur within a primarily recreational area and which include motels, resorts, hotels, stores, etc.
RT -	Existing and potential camp and trailer sites within a primarily recreational area
PP -	Existing county, state, federal, and private parks, race tracks, and fairgrounds.

Miscellaneous Lands

- | | |
|------|--|
| F - | Presently forested lands, or lands subject to forest management, which meet the requirements for irrigable land but which, because of climatic conditions and physiographic position, are better suited for timber production or some type of forest management program rather than for irrigated agriculture. |
| Vm - | Swamps and marshlands which are covered by water most of the time and usually support a heavy growth of phreatophytes. |
| N - | Includes all lands which fail to meet the requirements of the above classes. |

Major Categories of Land Classes

As indicated in Table 18 the lands mapped have been grouped into four major categories: irrigable lands, urban lands, recreational lands, and miscellaneous lands. Additional notes with respect to the survey of lands in 1957 are set forth in the following paragraphs.

Recreation on
Lake Van Norden
near
Soda Springs

Boating on
Lake Vera near
Nevada City

Irrigable Lands

Irrigable lands are grouped in appropriate classifications according to their suitability for development under irrigated agriculture and their crop adaptability. Presently irrigated lands are included within these classifications, but urban lands and recreational lands are not classed as to irrigability. In the survey the time element with respect to when the lands might be developed did not enter the determination of class, except that suitability for irrigated agriculture was necessarily considered in light of present agricultural technology.

There are many factors which influence the suitability of land for irrigation development. Since soil characteristics and the physiography of the landscape are the most stable of these factors, they were the only ones considered in the survey in classifying lands to their irrigability. The characteristics of the soil were established by examination of road cuts, ditch-banks, and the material from test holes, together with observations of the type and density of native vegetation and crops. Representative slopes throughout the area were measured with a clinometer. Other aspects, such as those economic factors related to the production and marketing of climatically adapted crops, the location of lands with respect to a water supply, and climatic conditions, were not considered in the basic classification. These latter factors are very important in estimating the nature of future cropping patterns and practices, and will be given due consideration when estimates are made of future water requirements.

Urban Lands

It is recognized that future urban expansion will encroach upon some of the irrigable lands. The location and extent of this type of development is a function of many variables. Because this land classification survey is an inventory of relatively unchanging physical conditions, no attempt was made to locate the areas of urban encroachment. Therefore, only those lands devoted to urban uses in 1957 are designated as "urban" lands.

Recreational Lands

Present trends indicate an expanding rate of use and demand for recreational facilities throughout the State. In view of these trends and the ever-increasing population, it is recognized that there will be a demand for substantial land areas for recreational purposes. This is particularly true of the mountainous regions where this type of development is expanding rather rapidly at the present time.

Generally speaking, all mountainous lands are suitable for some recreational use such as hunting, fishing, and similar outdoor activities. However, for purposes of this survey, lands classified for recreational use were limited to those which are now or in the future are expected to be used intensively for permanent and summer home tracts, commercial recreational areas, camp and trailer sites, and parks outside of urban areas. These are lands requiring intensive water service.

Primary considerations for classification of home tracts and camp and trailer sites were such physical factors as soil depth, slope, and rockiness; such aesthetic values as view, nearness to lakes, streams or seashore, or density and type of forest canopy suitable for the respective uses; and the plans of United States and California forest officials. An important factor in location of camp and trailer sites is the availability of a water supply, but isolation from existing roads did not influence site selection.

Miscellaneous Lands

Three types of lands are included as miscellaneous lands. These are: (1) irrigable forest management lands, (2) swamps and marshlands, and (3) other lands.

Irrigable forest management lands are those forested lands, rangelands, or lands subject to some type of forest management which have physical conditions making them susceptible to irrigation development but which, because of climatic conditions and physiographic position, are better suited for and are expected to remain under, their present uses.

Swamps and marshlands are those lands which generally have water standing on them and usually support a heavy growth of tules or other phreatophytes.

Approximately 801,000 acres, or 64 percent of the area of the hydrographic unit, are other lands, which failed to meet the requirements for the irrigable, urban, recreation, irrigable forest management, or swamp and marsh classification.

CHAPTER V. SUMMARY

The Yuba-Bear Rivers Hydrographic Unit comprises the 1,955 square-mile (1,251,120 acres) drainage area of the Yuba and Bear Rivers and minor streams draining the foothills between the Yuba River and the American River above the Sacramento Valley floor. Most of the terrain in the unit is mountainous, but valley and foothill lands constitute about 40 percent of the total area. Agriculture is the largest single commercial enterprise in the unit. Approximately one-tenth of the lands presently devoted to agriculture are dry-farmed; nine-tenths are irrigated. Major irrigated crops are pasture and deciduous orchard. Lumbering, recreation, and hydroelectric power development are also important activities. The largest communities in the area are Auburn, Grass Valley, and Nevada City.

Water Use

A survey was made of water uses supplied by diversion of surface water during 1957 and 1958, the object of which was to locate and obtain data with respect to all diversions of more than 10 acre-feet per year.

Continuous or periodic measurements were made on approximately 45 percent of the 374 diversions located during the year of survey. Twelve significant hydroelectric power-plants are located in the unit, but most of the diversions (275) are used for irrigation purposes. The largest diverters of water in the unit are Pacific Gas and Electric Company and Nevada Irrigation District.

The basis of water right for each diversion was determined insofar as possible. Most of the diversions are based on appropriative rights, many of which were established prior to the enactment of the Water Commission Act (1914), and are not of record, since such rights could be established simply by actual diversion and use of water. Generally, there are no official records of the riparian rights.

The Water Commission Act, now codified in Divisions 1 and 2 of the Water Code, requires formal application for the appropriation of water. As of May 29, 1959, a total of 470 currently valid applications had been made under provisions of the act in the Yuba-Bear Rivers Hydrographic Unit. Permits or licenses had been granted for 392 of these applications. Fifty-two of these applications were pending with the board, and 26 were incomplete.

Land Use

A detailed land use survey was conducted in the Yuba-Bear Rivers Hydrographic Unit during 1957. The areas of land devoted to present uses are summarized below and portrayed pictorially in Figure 1.

<u>Use</u>	<u>Area, in acres</u>
Agricultural lands	
Lands irrigated in 1958	43,880
Lands normally irrigated but idle or fallow in 1957	530
Meadowlands	5,260
Dry-farmed lands	<u>4,900</u>
Total agriculture	54,660
Recreational lands	1,540
Urban lands	8,020
Native vegetation and marshlands	<u>1,186,990</u>
Total area of unit	1,251,120

Of the 43,880 acres of land irrigated, 43,780 were irrigated with surface water and 100 with ground water.

Land Classification

A detailed agricultural and recreational land classification survey was conducted in the unit in 1957. In Nevada and Placer Counties a complete new survey was conducted, while in Butte, Plumas, Sierra, and Yuba Counties the agricultural land class reported in Bulletin No. 58 was utilized with some minor modifications. Results of the survey are summarized below and presented pictorially in Figure 2.

<u>Classification</u>	<u>Area, in acres</u>
Irrigable agricultural lands	314,320
Present urban lands	8,020
Recreational lands	14,420
Miscellaneous lands	
Irrigable forest management lands	113,130
Other lands (including swamps and marshlands)	<u>801,230</u>
Total area of unit	1,251,120

About 92 percent of the irrigable agricultural lands are located in the Auburn Ravine, Camp Beale, Camp Far West, Combie, Coon Creek, Deer Creek, Dry Creek, French Corral, French Dry Creek, Rocklin, and Wolf Creek Subunits. Approximately 97 percent of the recreational lands are located in the higher mountainous areas of the Alleghany, Bullards Bar, Donner Pass, Dutch Flat, French Dry Creek, Goodyears Bar, La Porte, Pike, and Sierra City Subunits. The majority of the irrigable forest management lands are located in the Alleghany, Bullards Bar, Deer Creek, Donner Pass, Dutch Flat, French Dry Creek, Greenhorn Creek, Pike, and Washington Subunits.

APPENDIX A
STATEWIDE WATER RESOURCES AND WATER
REQUIREMENTS PROGRAM

APPENDIX A

STATEWIDE WATER RESOURCES AND WATER REQUIREMENTS PROGRAM

California's major water problem today is that of development and delivery of supplemental water supplies to meet increasing water requirements throughout the State. The problem involves: (1) the regulation of seasonal and cyclic fluctuation of streamflow to meet demand schedules in the areas of origin, and (2) the transmission of regulated surplus flows over long distances to areas of deficiency. The development and long-distance transfer of water is currently accomplished by such major facilities as the federal Central Valley Project and the Colorado River Aqueduct of The Metropolitan Water District of Southern California. However, such development and transfer will be considerably broadened in scope by the State Water Facilities.

Consumptive water requirements of the State on a basin-wide basis were estimated in State Water Resources Board Bulletin No. 2, "Water Utilization and Requirements of California," June 1955. However, to provide for local water needs while considering specific export projects, more detailed information must be made available on present and projected future water requirements of the areas in which the projects are to be built. This has necessitated the considerably more detailed collection and analysis of data on hydrology, land use and land capability, and economics.

Recognizing that additional information is needed if the water needs of areas of origin are to be adequately protected in large-scale water development projects, the 1956 Legislature authorized an investigation to determine the water resources and water requirements of the respective watersheds in the State. The authorization is contained in Chapter 61, Statutes of 1956, as amended by Chapter 2025, Statutes of 1959. This legislation is codified in Section 232 of the Water Code as follows:

"232. The Legislature finds and declares that in providing for the full development and utilization of the water resources of this State it is necessary to obtain for consideration by the Legislature and the people, information as to the water which can be made available for exportation from the watersheds in which it originates without depriving those watersheds of water necessary for beneficial uses therein. To this end, the department is authorized and directed to conduct investigations and hearings and to prepare findings therefrom and to report thereon to the Legislature at the earliest possible date with respect to the following matters:

(a) The boundaries of the respective watersheds of the State and the quantities of water originating therein;

(b) The quantities of water reasonably required for ultimate beneficial use in the respective watersheds;

(c) The quantities of water, if any, available for export from the respective watersheds;

(d) The areas which can be served by the water available for export from each watershed; and

(e) The present use of water within each watershed together with the apparent claim of water right attaching thereto, excluding individual uses of water involving diversions of small quantities which, in the judgment of the Director of Water Resources, are insufficient in the aggregate to materially affect the quantitative determinations included in the report.

"Before adopting any findings which are reported to the Legislature, the department shall hold public hearings after reasonable notice, at which all interested persons may be heard."

For purposes of this investigation, the State has been divided into major hydrographic areas. These areas, in turn, have been subdivided into hydrographic units generally comprising watersheds of individual rivers. These watersheds are being field surveyed in some detail, and, where previous detailed studies have been made, the information will be brought up to date. Water resources and water requirements will be determined and reported in a bulletin for each of the hydrographic areas. Since it requires many years to gather sufficient data to make adequate analyses of water resources and water requirements, and, in order to make the data on present land and water use available when they are most useful, surveys of land and water use are being made and published separately for each of the hydrographic units. Bulletin No. 94-3, "Land and Water Use in Yuba-Bear Rivers Hydrographic Unit," is the third of a series reporting the results of these surveys.

At a future date, estimates, largely based on the land and water use surveys, will be made of quantities of water reasonably required for future beneficial use in each watershed. The quantity of water potentially available for export from each watershed will be determined after allowances are made for the satisfaction of the local requirements and prior rights to divert water to other areas. For those watersheds in which no exportable water is available, the water supply deficiency will be determined. These estimates will be published as they become available, in such form as to make possible a county-by-county determination.

The calculations of future water requirements will be based, in part, on predicted future land uses derived from land classification surveys, economic studies, population forecasts, industrial and agricultural development, and recreational needs. Agricultural water requirements will be based on unit water use by the various predicted crop types; urban and recreational requirements on per capita water use values; fish and wildlife requirements on minimum streamflow needed or on water demands for wildlife areas; and industrial water requirements on measured water deliveries to various types and sizes of industries now existing. In forecasting future industrial development, water quality problems will be given full consideration.

Water resources will be determined from records of all stream gaging stations, including new stations which were established for this and other investigations of the department. The new stations were generally constructed on streams which originate in the smaller watersheds for which runoff data are necessary but for which no data have been available. As part of this investigation, two new stream gaging stations were added to the existing network of stations in the Yuba-Bear Rivers Hydrographic Unit. These stations were installed:

<u>Stream gaging station</u>	<u>Date installed</u>
Wolf Creek near Wolf	May 28, 1957
Deer Creek near Nevada City	June 19, 1957

-----	--	------

APPENDIX C
LEGAL CONSIDERATIONS

There are set forth in the following paragraphs brief general statements with respect to the California law of water rights to supplement and to provide a background for information on water rights contained in Chapter II. Also included is a tabulation of currently active applications to appropriate water within Yuba-Bear Rivers Hydrographic Unit filed with the State Water Rights Board.

California Water Rights

In California, water rights convey only the right to use water. Until absolute possession of water is acquired by some artificial means, no one owns water. However, the owner of water rights is entitled to enjoy them without interference by other users who have rights which are inferior to his.

Five kinds of water rights are recognized in California. These are riparian, overlying, appropriative, prescriptive, and pueblo. Riparian rights attach to surface water and water flowing in known and definite subterranean channels, while overlying rights attach only to underground water. Appropriative and prescriptive rights may be acquired in either surface or underground waters. Pueblo rights are now exercised in California only by the Cities of Los Angeles and San Diego, each of which has a paramount right to satisfy the former Mexican pueblo from which each sprang.

All water rights, both to surface and to underground water, are subject to the doctrine of reasonable beneficial use expressed in Section 3 of Article 14 of the California Constitution, and Water Code Sections 100 and 101. This doctrine limits water rights to the quantity of water reasonably required for beneficial use and prohibits waste, unreasonable use, and unreasonable methods of use or diversion.

Riparian Rights

A riparian right entitles the land owner to take water directly from a natural watercourse for use on lands which border or have frontage on the watercourse. However, the rights of the owner of riparian land are limited to the reasonable beneficial use of the natural flow of water which passes his land. Riparian rights pass with the title to the land, unless expressly reserved or excepted from the interests transferred, and are not gained by use or lost by mere nonuse. Although the land must be contiguous to the watercourse, the length of the frontage is not determinative of the rights; a large tract with a small frontage on a stream, may be riparian to the stream. But the original grant determines the character of the land, and only the smallest contiguous tract held under a single title retains riparian rights.

A riparian owner has no right to any specified amount of the water of a stream as against other riparian owners. He has rights only to a reasonable share from the stream — a correlative right which he shares mutually with other riparian owners. In the event of insufficient water

for all, the available supply must be apportioned, except that an upper riparian owner may take the whole supply if necessary for domestic use. As against appropriators, the riparian owner has the paramount right to all the water of the stream which he can put to reasonable beneficial use, but that is the extent of his rights, and the appropriator can take the surplus.

Riparian rights do not authorize use of water on nonriparian land, nor do they permit the seasonal storage of water. Neither do they prevent temporary appropriation by others of water not presently needed for use on riparian land.

A parcel of land becomes nonriparian when severed from land bordering the stream, unless the riparian rights are reserved for the severed parcel by the grantor. Riparian rights may be destroyed when purportedly transferred apart from the land by grant, contract, or condemnation, and may be impaired or lost through prescription.

Overlying Rights

Owners of lands overlying a common underground water supply have the right to withdraw water for reasonable beneficial use of their overlying lands. Such overlying rights are analogous to riparian rights, in that both are based on ownership of land, and the rights of each overlying owner are mutual and correlative to the rights of all other owners. In the case of insufficient water to fully supply the requirements of all, the available supply must be equitably apportioned.

Overlying rights do not include use of water on nonoverlying land. However, surplus water not presently required for beneficial use on overlying land, and which may be withdrawn without creating an overdraft on the ground water supply, may be appropriated for use on nonoverlying land. But the overlying rights are paramount and all appropriative rights are subject to the future requirements of overlying land.

Appropriative Rights

An appropriation of water is any taking of water for other than riparian or overlying uses, whether such taking is from the underground by wells or from surface stream by direct diversion or storage. An appropriator, in the legal sense, is one who initially takes water without possessing rights which are based on the ownership of land. As between appropriators, the one first in this is first in right. A prior appropriator may take all the water he needs up to the full amount to which he is entitled before a later appropriator may take any.

Normally, appropriative rights are inferior to riparian rights. An exception to this is the case of an appropriation of water diverted from streams flowing through vacant public lands before the riparian lands were withdrawn from the domain of the United States. The appropriative diversions or the lands they serve may be either upstream or downstream from the riparian lands. Any water not needed for the reasonable beneficial uses of those having prior rights may properly be appropriated.

No formal or statutory procedure is or ever has been prescribed or required in this state for those who take water by means of wells from underground percolating waters or underground basins. An appropriative right to take surplus water from such sources is acquired by extracting such water from the underground and applying it to beneficial uses.

Provided the development and application to use are completed with reasonable diligence, the priority of the right as against another appropriator related back to the first substantial act toward putting the water to use or to the date of application. Until 1872, water flowing in natural streams was appropriated by taking the water.

Sections 1410 through 1422 of the Civil Code, enacted in 1872, established a permissive procedure for perfecting an appropriation of surface water. Provision was made for posting a notice of appropriation at the proposed point of diversion and recording a copy with the county recorder. If the statutory procedure were followed and the appropriation completed with due diligence, priority related back to the date of posting; otherwise, priority was established only when the water was put to beneficial use.

Since the effective date of the Water Commission Act of 1913, December 19, 1914, appropriation of surface water and water in subterranean streams flowing in known and definite channels has been by compliance with required statutory procedure. An appropriation of such water now can be made in accordance with the provisions of Part 2, Division 2 of the Water Code (Water Code Sections 1200 to 1801). An application

to appropriate unappropriated water must be filed with the State Water Rights Board. If the application is approved, a permit is issued authorizing the appropriation. When the appropriation has been completed, an inspection is made and a license is issued, to the extent of beneficial use, provided the terms and conditions of the permit have been fulfilled. The priority of a permit or license relates back to the date of the appropriation.

A right to appropriate water may be lost either by abandonment or by continuous nonuse. To constitute abandonment, there must be concurrence of act and intent, wherein possession is relinquished with no intent to resume it for a beneficial use. Abandonment is, therefore, always voluntary and factual. In the case of an appropriation initiated prior to 1914, continuous nonuse for a period of five years results in the loss of appropriative water rights. In the case of appropriative rights acquired pursuant to the Water Commission Act or the Water Code, continuous nonuse for a period of only three years may result in loss of such rights.

Where ground water and surface water are interconnected, one acting as a tributary to the other, both are treated as part of a common supply and users of water from either source are entitled to protection from substantial injury as a result of use by others of water from the other source. Thus, an owner of land riparian to a stream may have his right to the use of water protected against impairment by an appropriator of percolating ground water tributary to the stream and required for the maintenance and support of its

flow. Likewise, where water from a stream percolates to a ground water basin or stratum, the owner of land overlying the ground water supply may be protected from an appropriation of water from the stream if this causes a substantial impairment of the ground water supply. As between riparian use of surface water and overlying use of ground water tributary to the stream, a sharing of the available water supply on the basis of reasonable beneficial use should be made.

Prescriptive Rights

It is possible to appropriate surface or ground water which is presently needed by others to satisfy riparian, overlying, or prior appropriative rights. Such appropriations may ripen into prescriptive rights where the use is actual, open and notorious, hostile and adverse to the original owners, continuous and uninterrupted for the statutory period of five years, made under claim of right, and with payment of taxes whenever such have been levied on the water rights. Absence of any of these essentials precludes the acquisition of prescriptive water rights.

Prescription thus requires that where the rightful owner for a period of five years, either knows or should know of the adverse taking and fails to take any physical or legal steps to interrupt such taking. An absolute right is acquired to a fixed amount of water by prescription, the quantity being determined by beneficial use, irrespective of the needs or demands, of the injured riparian, overlying, or prior appropriative user. However, present use is the measure

of the prescriptive right, and future needs cannot be included.

Riparian rights, overlying rights, appropriative rights, and prescriptive rights may be lost or diminished by prescription. While there is sufficient water flowing in a stream to supply the wants of all parties, the use of the water by anyone does not deprive the others of their water supply and, hence, is not an invasion of their rights. The same principle applies to a downstream diversion of water as against the rights of an upstream riparian landowner or prior appropriator. At times when the safe yield of a ground water basin exceeds the needs of overlying landowners and appropriators, their prior rights are not invaded by a later appropriative taking of water from the underground supply. The later appropriation becomes adverse only when the ground water basin is overdrawn; that is, when the annual draft exceeds the safe annual yield. Although neither an overlying owner nor a prior appropriator may prevent a taking of surplus water, either the owner or the appropriator may institute legal proceedings to safeguard the supply once a surplus ceases to exist, and may enjoin any additional use beyond the point of safe yield. Since prescriptive rights can only be acquired to nonsurplus water, these rights cannot ordinarily be acquired against the future needs of riparian or overlying owners.

The prior appropriator, lower riparian, or overlying owner may protect his rights for his present needs against an adverse appropriator by actually taking the needed water before the five-year period has run, or by the aid of the courts

in the form of a declaratory judgment or injunction within the five-year period.

Determination of Water Rights

Under provisions of the Water Code, actions involving determination of rights to the use of water brought before either state or federal courts may, at the court's discretion, be referred to the State Water Rights Board. Under provisions of Water Code Section 2000, the court may appoint the board to referee "ny or all issues involved in the suit," or under Section 2001, it may limit the reference to "investigations of and report upon any or all physical facts involved." This reference procedure may be followed in suits involving either surface or ground waters, or both.

An alternative procedure is available for adjudication of rights to the use of water of streams, lakes, and other bodies of water, but the method excludes the determination of rights to take water from an underground supply other than from a subterranean stream flowing through known and definite channels. Water Code Sections 2500 to 2900, inclusive, authorize the initiation of such proceedings.

Litigation Concerning Local Water Rights

Water rights in the Yuba-Bear Rivers Hydrographic Unit are based primarily upon riparian status and upon appropriation, as further delimited by private agreements, and adjudications. One major suit, Thomas Sleeman v. Nevada Irrigation District (1932), Nevada County Superior Court

Case No. 5566, recorded in Book 34, page 34, of Nevada County Official Records, has defined the rights of a number of the water users on Wolf Creek. The following is a brief description of the suit and its results.

Thomas Sleeman v. Nevada Irrigation District

In this case, Thomas Sleeman, as owner of riparian lands along Wolf Creek south of Grass Valley in Nevada County, sued Nevada Irrigation District to establish the relationship of their respective water rights. Nevada Irrigation District in turn filed a cross-complaint against Sleeman and other users of Wolf Creek waters. The judgment, dated October 8, 1932, establishes the diversion entitlements of the plaintiff and cross-defendants as against the defendant to the natural runoff of Wolf Creek. Any water that is imported directly to Wolf Creek, or indirectly through the mines upstream, by the defendant is not natural runoff and may not be diverted by the plaintiff or cross-defendants. In addition to this imported water, the defendant may divert as much of the natural runoff of Wolf Creek flowing at the head of the defendant's Tarr Ditch, that is not required to supply the rights of the plaintiffs and cross-defendants.

APPENDIX D

DETAILED DESCRIPTIONS OF CERTAIN SURFACE WATER DIVERSIONS

This appendix presents additional data on surface water diversions by Browns Valley Irrigation District, Nevada Irrigation District, and Pacific Gas and Electric Company which could not be described adequately in Table 6 of the report. The points of diversion and the diversion ditch systems are delineated in detail on the various sheets of Plate 3, and for Nevada Irrigation District and Pacific Gas and Electric Company are summarized on Plates 4 and 5, respectively.

Browns Valley Irrigation District

The Browns Valley Irrigation District was organized September 19, 1888, under the Wright Irrigation Act. Bonds were sold, and construction commenced in November 1889 on the main ditch and laterals to serve the area. The original diversion structure was a timber crib dam located on the North Yuba River about 2.5 miles above its confluence with the Middle Yuba River. From the diversion structure to what is now Colgate, a distance of approximately 7 miles, a wooden flume with an estimated capacity of 75 cubic-feet per second was constructed; and from the terminus of the flume to Browns Valley, 41 miles of main ditch, which contained about 2 miles of short wooden flumes, were constructed.

Shortly after construction commenced on this system, the district purchased 29 miles of ditch and a timber crib dam from Forbestown Ditch Company. The dam was located on Dry Creek near

Oregon House. Ten miles of the ditch were abandoned, 12 miles were enlarged to become part of the Browns Valley Ditch, and the remaining 7 miles became a lateral of the Browns Valley Ditch known as the Sicard Flat Ditch. The system was completed in 1893.

The district leased the use of the water it claimed from the North Yuba River (10,000 miner's inches) to Frank Page in August 1893. The water was to be used for "mechanical purposes" (power production), and the lease was for a 50-year period. In 1897 Page transferred the lease to John Martin, who constructed the Yuba Powerhouse in a section of Browns Valley known as Wild Hog Glory. The lease was then transferred to Yuba Power Company the same year, to Yuba Electric Power Company in 1899, to A. S. Morally in May 1900, and to Bay Counties Power Company in June 1900. The Yuba Powerhouse was in operation until 1911.

By September 1899 the Yuba Electric Power Company had raised the height of the North Yuba Dam, constructed Colgate Powerhouse at the Yuba River crossing of Missouri Bar trail, and constructed the Colgate Flume parallel to and directly above the original Browns Valley Flume to supply the new powerplant and Browns Valley Ditch. A dam which created Lake Francis on Dobbins Creek near the community of Dobbins was constructed in 1901 to provide a supplementary supply for the plant.

In 1941 Pacific Gas and Electric Company, as successor to the Bay Counties Power Company and the Yuba Electric Power

Company, constructed Colgate Tunnel from a diversion dam to the Colgate Powerhouse penstock. The dam was located 1.5 miles downstream from the company's Bullards Bar Dam. A contract between Browns Valley Irrigation District and Pacific Gas and Electric Company provided for delivery of a portion of the district's water through the Colgate Tunnel to the Browns Valley Ditch. The water was delivered at a point near the head of the penstock, as a substitute for diversion from the river through the Colgate Flume. None of the company's water from Lake Francis could enter the new pressure system created by the tunnel; so a provision was included in the contract which allowed the company to deliver the Lake Francis water to the district in lieu of a similar amount of North Yuba River water diverted through Colgate Tunnel.

Water from the North Yuba River is diverted under an old appropriation established prior to the enactment of the Water Commission Act.

Approximately two-thirds of the gross area of the Browns Valley Irrigation District lies within the Yuba-Bear Rivers Hydrographic Unit and is supplied by the Browns Valley and Sicard Flat Ditches. The remainder of the district, which lies mostly to the west of the hydrographic unit, is served by the Mahle and Olive Hill Ditches, both of which are laterals of the Browns Valley Ditch and export water from the hydrographic unit.

From November 1 to April 1 of each year, water is received by the district at a point near the hydrographic unit boundary approximately 2.5 miles east of Loma Rica. This

water is delivered to the Browns Valley Ditch from diversion 17N/6E-4H1, owned by Frank Carmichael, and is received in exchange for water delivered to him through the Mahle Ditch during the irrigation season.

Nevada Irrigation District

Consideration was first given to the formation of an irrigation system in Nevada County in 1917. At that time landowners in the foothills feared that water supplies originating in the mountainous area to the east would be developed for use in the Sacramento Valley, or that hydro-electric power would be developed in a manner incompatible with full irrigation development in the foothills. In 1918 a local committee formed, and made several water filings to preserve the use of the water for the foothill area.

On March 15, 1921, another local committee presented a petition for the formation of an irrigation district to the Nevada County Supervisors. An election took place on August 4, 1921, which resulted in the formation of Nevada Irrigation District. At that time the district consisted of 202,000 acres in Nevada County.

It was realized at the outset that the development of the irrigation system would require the revenue from hydro-electric power production to finance a major portion of the project. This was accomplished by a contract with Pacific Gas and Electric Company whereby water developed by Nevada Irrigation District in the mountain regions would be transferred

to the company for the development of hydroelectric power. Basically the contract provided that the water would then be returned to the district in the foothill regions.

The lands within the newly formed district were not entirely without irrigation at the time of its formation. Many ditches that had been constructed to serve mines in Nevada and Placer Counties were serving small scattered parcels of irrigated land.

Construction was started in the mountain regions, and existing distribution systems within the district were purchased following approval of the water right applications by the State Division of Water Rights and the Federal Power Commission; approval of the necessary rights-of-way over public land by the Federal Power Commission; and the approval by the Bond Certification Commission for the sale of \$7,500,000 of bonds. Purchase of the distribution systems and the Bowman Lake properties was completed in 1925.

During the time that the district was getting its construction program under way, landowners in Placer County between Auburn Ravine and Bear River became interested in an additional water supply. On December 10, 1926, approximately 66,500 acres in Placer County were annexed to the district, bringing the total area to about 268,500 acres.

On July 1, 1927, water was first delivered to Pacific Gas and Electric Company at Lake Spaulding. On May 15, 1928, the district voted a second bond issue of \$2,595,000 to take care of the increased cost brought about

by the inclusion of the Placer County unit. This money, along with that remaining from the original bond issue, was to be used for construction of storage on Deer Creek at the Scotts Flat site; general extension of the already purchased distribution system in Nevada County; construction of Van Giesen Dam on the Bear River; purchase from Pacific Gas and Electric Company of its Gold Hill and Ophir irrigation systems in Placer County; and general extension of the distribution system in Placer County. This work was completed in the early 1930's, although some difficulty was encountered because of lack of funds needed to retire outstanding warrants and to complete the distribution system in Placer County.

The district is divided into three divisions for operational purposes. The Mountain Division comprises the mountainous area wherein water is developed and stored for the production of hydroelectric power and later use in the foothill regions. The Nevada and Placer Divisions encompass the foothill lands within the district boundary in Nevada and Placer Counties, respectively.

The location of the diversion facilities operated by the district are shown on sheets 1 through 23 of Plate 2, and sheets 1 and 2 of Plate 4. The following paragraphs outline the functions and principal features of each division.

Mountain Division

The Mountain Division of Nevada Irrigation District consists of the several storage reservoirs on upstream reaches of the Middle and South Yuba Rivers and canals to divert the

stored water to the penstock of Spaulding Powerhouse No. 3, which is owned by Pacific Gas and Electric Company. The two principal conduits for transporting this water are Milton-Bowman Tunnel and Bowman-Spaulding Conduit. The water is used for power generation at the powerplant, and is subsequently released to Lake Spaulding. The water is then released from Lake Spaulding for additional power generation by the company, and is returned to the district at six locations for use in the Placer Division, and at the Deer Creek Powerhouse tailrace for use in the Nevada Division. Water rights for all but two of the diversions in this division are based on appropriation applications filed with the State in accordance with the Water Commission Act.

The following is a description of each diversion:

Milton-Bowman Tunnel and Milton Reservoir (Diversion 19N/12E-12N1). Milton Reservoir, with a capacity of 800 acre-feet, was constructed by Nevada Irrigation District in 1928 for purposes of storing runoff to be diverted through the Milton-Bowman Tunnel to Bowman Reservoir. Additional water is received into the Milton-Bowman Tunnel from diversions 19N/12E-14F1 and 19N/12E-14H1, approximately 0.5 mile from Milton Reservoir. These diversions were constructed in 1934.

Upstream Reservoirs Releasing to Bowman Lake. The various reservoirs located upstream from Bowman Lake for the purpose of storing winter runoff for subsequent releases during the summer are: Jackson Lake, French Lake, Island Lake, and Sawmill Lake. The aggregate capacity of these reservoirs

is 19,445 acre-feet, of which 13,840 acre-feet are impounded in French Lake. French Lake and Island Lake are located upstream from Sawmill Lake, thus enabling waters released from them to be regulated at Sawmill Lake.

All of these reservoirs were constructed prior to the formation of Nevada Irrigation District, and were purchased by the district. Island Lake and Sawmill Lake were purchased from North Bloomfield Gravel and Mining Company, November 25, 1925; French Lake from Summit Water and Irrigation Company, January 8, 1926; and Jackson Lake from San Juan Gold Mining Company, June 21, 1938.

Bowman Lake (Diversion 18N/12E-8C1). Bowman Lake was purchased from the Northern Water and Power Company, whose predecessor was the North Bloomfield Gravel and Mining Company on November 25, 1925. Shortly thereafter construction commenced on new dams at the lake to increase the storage capacity. The original dam was constructed in 1872, and diverted water into the Bloomfield Ditch, which followed the main ridge between the South and Middle Forks of the Yuba River from the lake to the North Bloomfield Mine. At present the principal purpose of Bowman Lake is to store and regulate water released from Milton-Bowman Tunnel, Sawmill Lake, Island Lake, French Lake, and Jackson Lake for rediversion by the Bowman-Spaulding Conduit. This is accomplished by releasing into Canyon Creek for rediversion at the Bowman-Spaulding Conduit.

Bowman-Spaulding Conduit (Diversions 18N/12E-8C2).

Following the purchase of Bowman Lake and other upstream reservoirs, construction commenced on the Bowman-Spaulding Conduit to transmit Bowman Lake water to Pacific Gas and Electric Company's Spaulding Powerhouse No. 3. The conduit diverts from Canyon Creek 0.2 mile below Bowman Lake, and releases water to the powerplant at the head of the penstock.

Diversions Supplementing Bowman-Spaulding Conduit.

During the construction of the Bowman Spaulding Conduit, five additional diversions were constructed on streams between Bowman Lake and Lake Spaulding. These diversions were on Fall Creek (Diversions 17N/12E-6D1), Trap Creek (Diversions 17N/12E-6M1), Rucker Creek (Diversions 17N/12E-7H1), Clear Creek (Diversions 18N/11E-36J1), and Texas Creek (Diversions 18N/12E-19P1).

Lakes owned by Pacific Gas and Electric Company release water through these streams for rediversion into the Bowman-Spaulding Conduit. The Texas Creek, Fall Creek, and Rucker Creek diversions replaced diversions owned by Pacific Gas and Electric Company which diverted to Lake Spaulding through the Texas and Fall Creeks Ditch.

The diversion of Trap Creek, Rucker Creek, and Clear Creek is accomplished by the interception of these creeks by the Bowman-Spaulding Conduit.

Nevada Division

The Nevada Division of Nevada Irrigation District encompasses all district lands in Nevada County. Areas of use within this division receive supply from ditches diverting from

Deer Creek, Wolf Creek, and South Yuba River. Ditches diverting from Deer Creek are supplemented by deliveries from Pacific Gas and Electric Company through Its Deer Creek Powerhouse. In addition to this, water is conserved in Scotts Flat Reservoir on Deer Creek. All water diverted in the Nevada Division is used within that division, except for releases from D-S and Cascade Canals to Little Greenhorn Creek for rediversion in the Placer Division.

In 1957 the district irrigated approximately 8,940 acres in the division in addition to releasing to natural stream channels for diversion by individually owned diversions. Prior to the formation of the district, approximately 6,600 acres were irrigated in this area by other organizations. Pacific Gas and Electric Company provided service in the vicinity of Nevada City and Grass Valley; the Excelsior Water and Mining Company served lands west of Grass Valley; and the Blue Point Mining Company served an area southwest of Grass Valley. Crops in the district's Nevada Division service area consist primarily of irrigated pasture and deciduous orchard, as they did in 1921. In addition to irrigation, stockwatering, and individual domestic service, water is also supplied to the Cities of Grass Valley and Nevada City.

In general, water is taken at diversions in this division under appropriative water rights filed with the State in accordance with the Water Commission Act. The exceptions

are Tarr Ditch, where water is taken under an adjudicated right, and Stone Ditch, where water is taken under an appropriative right established prior to the enactment of the Water Commission Act. All of the diversions from Deer Creek, with the exception of Scotts Flat Dam, divert under water right application No. 1615 which allows an aggregate total of 100 cubic feet per second to be diverted from Deer Creek through eight ditches. Of these eight ditches, seven are now in use and are reported as diversions herein. Following is a short discussion of the diversions within the Nevada Division.

Cascade Canal (Diversion 17N/10E-34E1). Cascade Canal was purchased from Pacific Gas and Electric Company, as successor to the South Yuba Water Company, on November 23, 1926. This ditch diverts from Deer Creek, approximately one-fourth mile downstream from the Deer Creek Powerhouse, through 16 miles of earth ditch, wood flume, and pipeline. From its diversion point it flows to the Empire and Yuba Reservoirs, located about 3 miles east of Grass Valley. At Yuba Reservoir flow is released to Rattlesnake Ditch which in turn releases part of its flow to Chicago Park Ditch. Rattlesnake Ditch serves the area between Wolf Creek and South Wolf Creek with its laterals, the Cunningham, Kyler, Union Hill, White, Forest Springs, and Stockton Hill Ditches. Chicago Park Ditch follows the ridge between Wolf Creek and Greenhorn Creek, and terminates near Mt. Olive. These ditches distribute the water in the Greenhorn Creek, Wolf Creek, and Lake Combie Subunits for irrigation, stockwatering, and domestic uses. Water may be released from Banner Reservoir, located on a lateral of the

Cascade Canal, to supplement the D-S Canal. Water may also be released from the Chicago Park Ditch to Little Greenhorn Creek to supplement the district's diversions from the Bear River in the Placer Division.

China Ditch (Diversion 16N/7E-20E1). China Ditch diverts from Deer Creek through 10 miles of earth ditch and wood flume for irrigation, stockwatering, and domestic uses in the area of Smartville and to the west of Smartville in the Deer Creek, Dry Creek, French Dry Creek, and Camp Beale Subunits. Principal laterals distributing the water in these areas are the Farm and Ousley Ditches. Additional supply for this diversion is received from the South Yuba River by releases from Excelsior Ditch into Deer Creek approximately one-fourth mile upstream from the diversion point of China Ditch.

China Ditch was constructed in 1860 to replace that part of the South Yuba Ditch (now Excelsior Ditch) from Deer Creek to the Smartville area. On September 14, 1925, the Nevada Irrigation District purchased the ditch from the Excelsior Mining and Water Company, successor to Excelsior Mining Company, Excelsior Water Company, and Excelsior Canal Company.

D-S Canal and Deer Creek Reservoir (Diversion 16N/9E-10B1). Deer Creek Reservoir, with a capacity of 1,400 acre-feet, and D-S Canal, which diverts directly from the reservoir, were constructed by Nevada Irrigation District in 1928 to further expand its distribution system in the Nevada Division. The canal, with its various distribution laterals, supplies water for irrigation, domestic and stockwatering uses in the

Deer Creek and Wolf Creek Subunits, in addition to supplying the City of Grass Valley and a portion of Nevada City. The principal services from the D-S Canal are to Grass Valley Ditch and Tarr Ditch via Wolf Creek, the former supplying Allison Ranch Ditch and its laterals, Cory, James, and Lafayette Ditches.

Portions of the water diverted through D-S Canal are released for supplemental supply to other Nevada Irrigation District facilities. At the terminus of Grass Valley Ditch, water is released to Rough and Ready Ditch. At the ends of Cory, James, and Allison Ranch Ditches, water is released to French Ravine and Wolf Creek for rediversion by Tarr and French Ravine Ditches. The D-S Canal terminates at and releases excess water into Little Greenhorn Creek, a tributary of Bear River, for use in the Placer Division. This water is normally rediverted from the Bear River through the Bear River Canal for use in Pacific Gas and Electric Company's power system, and returned to Nevada Irrigation District at several locations in the Placer Division.

Excelsior Ditch (Diversion 17N/8E-27H1). Excelsior Ditch diverts from the South Yuba River through approximately 19 miles of earth ditch and wood flume, including its principal extension, Keystone Ditch, for irrigation, stockwatering, and domestic uses in the French Corral, French Dry Creek, and Deer Creek Subunits.

Construction of Excelsior Ditch commenced in 1856, and water was first delivered to the Smartville area in the fall of 1859. At this time the canal was known as the South Yuba Ditch, and the water diverted was used entirely for mining purposes.

Shortly after the ditch was constructed it was decided to abandon that portion of the ditch from its crossing of Deer Creek to its terminus and to carry the water to the mines by a different route. China Ditch was constructed for this purpose in 1860. Excelsior Ditch was constructed by the Excelsior Canal Company, which was succeeded in order by the Excelsior Water Company, the Excelsior Mining Company, and the Excelsior Water and Mining Company. On September 14, 1925, the ditch was purchased by Nevada Irrigation District from the Excelsior Water and Mining Company.

The major portion of flows in Excelsior Ditch is spilled to Deer Creek for rediversion through China Ditch.

Newtown Ditch (Diversion 16N/8E-12K1). Newtown Ditch, with its principal laterals, Pleasant Valley and Williams Ditches, diverts from Deer Creek through 19 miles of earth ditch and wood flume to supply water for irrigation, stockwatering, and domestic uses in the Deer Creek and French Corral Subunits. Excess water in Pleasant Valley Ditch is spilled into the Excelsior Ditch in the vicinity of Pleasant Valley.

Newtown Ditch was constructed in 1881 and purchased by Nevada Irrigation District on September 14, 1925, from the Excelsior Water and Mining Company.

Rough and Ready Ditch (Diversion 16N/9E-7H1). Rough and Ready Ditch diverts water from Deer Creek through approximately 13 miles of earth ditch for irrigation, domestic, and stockwatering uses in the Deer Creek Subunit. This ditch was constructed in 1850 for mining purposes in the area of Rough and Ready, but by the turn of the century all water diverted

was for agricultural use. On September 14, 1924, Nevada Irrigation District purchased Rough and Ready Ditch from Excelsior Water and Mining Company.

In addition to water diverted from Deer Creek by this ditch, water is received from D-S Canal through the Grass Valley Ditch. It is also possible for the Rough and Ready Ditch to spill water to supplement the Tunnel Ditch.

Scotts Flat Dam (Diversion 16N/9E-2R1). Scotts Flat Dam and Reservoir, with a capacity of 27,400 acre-feet, was constructed in 1947 by Nevada Irrigation District to store and regulate the flow of Deer Creek, including the discharge from Deer Creek Powerhouse. The water is released downstream for redistribution by the Tunnel, Newtown, China, and Rough and Ready Ditches and the D-S Canal. Recent plans for enlargement of the dam will increase the storage capacity to about 50,000 acre-feet.

Snow Mountain Ditch (Diversions 17N/10E-32M1 and 17N/10E-32E1). Snow Mountain Ditch was purchased from Pacific Gas and Electric Company, whose predecessor was the South Yuba Water Company, on November 23, 1926. The ditch was constructed prior to 1901. The ditch diverts from Deer Creek and receives supplemental supply through diversion 17N/10E-32E1 from the North Fork of Deer Creek at the crossing of the ditch over the creek. From this point the water flows along the north bank of Deer Creek through 15 miles of earth ditch and wood flume to its area of use north and northwest of Nevada City, in the French Corral and Deer Creek Subunits. Principal laterals distributing the water to the areas of use are the Cement Hill and Red Hill Ditches. In addition to irrigation, domestic,

and stockwatering uses, a portion of the Nevada City water supply is provided by the ditch.

Stone Ditch (Diversion 16N/8E-25C1). Stone Ditch diverts from Wolf Creek approximately a mile east of Grass Valley to irrigate a small parcel of land to the north of Wolf Creek and to supply Pacific Gas and Electric Company's gas plant in Grass Valley. This water is diverted under a 15-miner's inch appropriative water right established prior to 1914 and claimed by Pacific Gas and Electric Company. Since very little water flows this high on Wolf Creek during the irrigation season, water is released from the D-S Canal to augment the flow of Wolf Creek.

Tarr and French Ravine Ditches (Diversions 15N/8E-10R1 and 15N/8E-9K1). Tarr Ditch (Diversion 15N/8E-10R1) diverts from Wolf Creek through 62 miles of pipe, flume, and earth ditch. A large portion of this mileage is that of B Canal, a lateral the branches of which are Cole, Redinger, Viet Cameron, Wolf, Spoor, and Smith-Gordon Ditches and Clear Creek Lateral. The Smith-Gordon Ditch in turn has Bald Hill and Pet Hill Ditches as branches. French Ravine Ditch (Diversion 15N/8E-9K1) diverts from French Ravine into the Tarr Ditch approximately one and one-half miles from the diversion point of Tarr Ditch. Supplemental water for these diversions is provided by spills from the D-S Canal into French Ravine and Wolf Creek upstream from the diversion points.

Tarr Ditch diverts for irrigation, domestic, and stockwatering uses in the Wolf Creek, Dry Creek, Camp Far West, and Deer Creek Subunits. The ditch was constructed in 1858 by the

Nevada Reservoir Ditch Company to divert water from Wolf Creek to the mines near Smartville. At a later date the ownership was changed to New Blue Point Mining Company, which sold the ditch to Nevada Irrigation District on June 12, 1926. At the time of the purchase of this ditch, it was the principal irrigation source for the area southwest of Grass Valley.

Water right litigation concerning this ditch and other diversions from Wolf Creek took place in 1932, and the judgment established that only imported water and that natural runoff above the amounts to which certain downstream users are entitled could be diverted by Nevada Irrigation District. A further explanation of the proceeding is provided in Appendix C.

Tunnel Ditch (Diversion 16N/8E-18M1). Tunnel Ditch diverts from Deer Creek approximately one mile northeast of the community of Rough and Ready. The length of the ditch is 12 miles, which includes its two main laterals, Riffle Box and Rex Ditches. These ditches distribute water in the area west and southeast of Rough and Ready for irrigation, stockwatering, and domestic uses in Deer Creek Subunit.

Tunnel Ditch was constructed in 1852 for mining purposes in the vicinity of Rough and Ready. Shortly after the formation of Nevada Irrigation District, the ditch was purchased from the Excelsior Water and Mining Company. Additional supply is received for this diversion from irrigation tail water and spill from Rough and Ready Ditch.

Placer Division

The Placer Division of Nevada Irrigation District encompasses all of the district in Placer County. In 1957 approximately 14,300 acres were irrigated in the division by the district in addition to supplementing individual irrigation diversions by releasing to natural streams. Domestic and industrial water service was also supplied within the division.

The primary diversion facilities in this division are Van Giesen Dam, Gold Hill Canal, and Auburn Ravine Canal. The water supply developed by these facilities is augmented by water from the Mountain Division delivered through the Pacific Gas and Electric Company's power system. Deliveries by Pacific Gas and Electric Company are made at six locations. These deliveries are from Wise Canal through the Rock Creek North Ditch, from Fiddler Green Canal through the Ophir Pipe and Edgewood Pump, from two spills from South Canal to Auburn Ravine, and from releases down the Bear River from the head of the Bear River Canal. This water is in exchange for water delivered to Pacific Gas and Electric Company through the Bowman-Spaulding Conduit at Spaulding Powerhouse No. 3.

Water rights of the division fall into two categories. The first are based on appropriation applications filed with the State on all of the projects constructed by the district since its organization. The second are claims of appropriation by the predecessor companies from whom the district purchased water systems. The principal system in the latter category is the Gold Hill Canal system. This facility was purchased from

Pacific Gas and Electric Company, and includes basically the Gold Hill, Auburn Ravine, and Camp Far West Canals and their various laterals and extensions. Claimed rights for these systems are for 22 cubic feet per second from the Bear River at the Gold Hill diversion; 10 cubic feet per second from Auburn Ravine at the Auburn Ravine Canal; and for all of the water available from various streams at minor diversion points located within the area of the Gold Hill system.

Following is a description of each diversion in the Placer Division:

Van Giesen Dam and Lake Combie (Diversion 13N/8E-2E1).

Van Giesen Dam, which forms Lake Combie with a storage capacity of 7,164 acre-feet, was constructed by Nevada Irrigation District in 1928 to store and regulate flow of the Bear River. In addition to these functions, the reservoir reregulates water from Pacific Gas and Electric Company released to the Bear River at the head of the Bear River Canal. Water stored in the reservoir is used to supply Magnolia No. 3 Ditch and Gold Hill Canal.

Magnolia No. 3 Ditch (Diversion 13N/8E-2E2). Magnolia No. 3 Ditch was constructed by Nevada Irrigation District in 1934 to divert water from Lake Combie to the north of the Bear River for irrigation, stockwatering, and domestic uses in the Wolf Creek and Combie Subunits. Diversion is accomplished by means of either a hydraulic ram or an electric pump, each located at the dam, to raise the water to the ditch. The earth ditch, with its principal lateral, Hoefer Ditch, extends for 9 miles to the north of Lake Combie. Water that is spilled from the hydraulic ram returns to the Bear River and is rediverted by the Gold Hill Canal downstream.

Gold Hill Canal (Diversion 13N/8E-3H1). Gold Hill

Canal transmits water diverted from Bear River below Van Giesen Dam to the area north and west of Auburn. It has a length of 96.5 miles, made up of earth ditch, pipe, and wood flume. This length includes its principal laterals, the Combie-Ophir Canal, Lone Star Canal, Magnolia No. 1 Ditch, Gold Blossom Canal, Valley View Canal, and Dudley Canal.

Gold Hill Canal was constructed by the South Yuba Water Company prior to 1901 for mining purposes in the Gold Hill area; but as mining uses decreased, farmers in the area purchased the water for their crops. The canal was purchased in 1933 from Pacific Gas and Electric Company, successor of the South Yuba Water Company.

Water diverted through the Gold Hill Canal is for irrigation, domestic, and stockwatering uses in the Wolf Creek, Combie, Coon Creek, Auburn Ravine, and Camp Far West Subunits. The major portion of its use is in the Placer Division, although a portion of the water which is transmitted through Magnolia No. 1 Ditch is used in the Nevada Division north of the Bear River in Nevada County. A portion of the water released to the Valley View Canal is combined with water from Whisky Diggins Canal for use in Coon Creek Subunit.

Auburn Ravine Canal (Diversion 12N/7E-14A1). Auburn

Ravine Canal diverts from Auburn Ravine, at a point to the west of Auburn, to supplement the Gold Hill Canal. From the junction of this canal and Gold Hill Canal, water is distributed by the

Lincoln and Doty Ravine North Ditches, Gladding-Comstock Ditch, and the lower portion of the Gold Hill Canal. Additional supply is received from the Coon Creek Pump diverting to the Gladding-Comstock Ditch. These ditches supply water for irrigation, stockwatering, and domestic uses.

A large portion of the amount diverted from Auburn Ravine is supplied by two deliveries from Pacific Gas and Electric Company's South Canal by spill to Auburn Ravine.

Doty's South Ditch (Diversion 13N/6E-36G1). Doty's South Ditch diverts from Doty Ravine at a point to the northeast of Lincoln, and serves irrigated areas north and northwest of Lincoln in conjunction with water from the Gold Hill Canal. An interchange ditch, located approximately one mile downstream from the diversion point, allows water to be diverted from Doty's South Ditch into the Gold Hill Canal or vice versa.

Water diverted from Doty Ravine by this diversion is primarily return water from irrigation upstream.

Camp Far West Canal (Diversion 13N/7E-13N1). Camp Far West Canal diverts from Coon Creek at a point northwest of Auburn for irrigation, stockwatering, and domestic uses in the Coon Creek and Camp Far West Subunits.

The Camp Far West Canal was originally constructed for mining purposes, but in 1933, when Nevada Irrigation District purchased the canal from Pacific Gas and Electric Company, it was used entirely for irrigation.

Due to the relatively low flow of Coon Creek in the summer months, additional supply is delivered to this diversion via Orr Creek and Rock Creek. Deliveries are made through Gold Hill Canal at the Orr Creek Dam, a part of the Gold Hill Canal facilities, and through Rock Creek North Ditch from the Pacific Gas and Electric Company's Wise Canal.

Coon Creek Pump (Diversion 13N/6E-22A1). Coon Creek Pump diverts from Coon Creek into the Gladding-Comstock Ditch, which is an extension of the Auburn Ravine and Gold Hill Canals. The flow of water in Coon Creek at the point of diversion is sustained primarily by return water from irrigation upstream.

Pacific Gas and Electric Company

The Pacific Gas and Electric Company was incorporated on October 10, 1905. In the Yuba-Bear Rivers Hydrographic Unit area the company succeeded the California Gas and Electric Corporation. The corporation had purchased the Bay Counties Power Company on December 6, 1901 and the South Yuba Water Company on January 4, 1905. These companies were actively associated with most of the development of the present Pacific Gas and Electric Company water and power systems in the Yuba-Bear Rivers Hydrographic Unit.

The South Yuba Water Company had its beginning about 1850 in three small companies. These were the Rock Creek Water Company, Coyote and Deer Creek Water Company, and South Yuba Snow Mountain Ditch Company. In 1854 these companies consolidated under the name of Rock Creek, Deer Creek, and South Yuba Canal Company. The name was changed, along with subsequent incorporations of other small water companies, to the South Yuba Canal Company in 1870; to South Yuba Water and Mining Company in 1877; and finally to South Yuba Water Company in 1890.

During this period, and up to the time of its purchase by California Gas and Electric Corporation, the construction by the company and its predecessors included South Yuba Canal, Boardman Canal, the original Spaulding Dam, and most of the presently reported diversions from the South Yuba and Bear Rivers and their tributaries. In 1890 the Bear River Canal was purchased from the Bear River and Auburn Water and Mining Company by the South Yuba Water Company. About 1895 the company had an excess of usable water due to the decline of the hydraulic mining industry, and three powerplants were constructed by a subsidiary, the Central California Electric Company, to provide a use for this excess water. Today only one of the three, Alta Powerhouse, remains in commission.

The Bay Counties Power Company had its beginning in June 1900, when it purchased the Yuba Powerhouse in Browns Valley, Colgate Powerhouse, Colgate Flume, and Lake Francis Dam, from A. S. Morally. The Yuba Powerhouse was built by John Martin in 1897, and was successively sold to Yuba Power Company later in 1897, to Yuba Electric Power Company in February 1899, and to A. S. Morally in May 1900. The powerplant was in operation until 1911. The Colgate Powerhouse, the 7.6-mile Colgate Flume which was located just above and parallel to the old Browns Valley Irrigation District flume, and Lake Francis Dam were constructed by the Yuba Electric Power Company during the period February 1899 to May 1900.

During the first seven years following the organization of Pacific Gas and Electric Company, the only water development

for power was the construction of Deer Creek Powerhouse on Deer Creek at the terminus of the South Yuba Canal. In 1912, however, construction was started on the New Spaulding Dam and Drum Canal. Subsequently, Halsey and Wise Powerhouses were constructed on the Bear River and Wise Canals, respectively. Two other powerplants, Bullards Bar and Narrows, were constructed in 1924 and 1942, respectively, at dams already constructed for debris control, and in 1943 Dutch Flat Tunnel and Dutch Flat Powerhouse were placed in operation. Subsequent to the powerplant construction at Bullards Bar, the dam was purchased by the company. The Narrows Powerhouse utilizes the pressure head developed at Englebright Dam, which is owned by the California Debris Commission.

Many of the ditches acquired by Pacific Gas and Electric Company through the South Yuba Water Company were serving areas within the boundaries of Nevada Irrigation District at the time of its formation. The district's need for distribution facilities resulted in the sale to the district of all the company's irrigation ditches in Nevada County, and the Gold Hill and Ophir Ditch systems in Placer County. The sales of the facilities in Nevada County and Placer County were in 1926 and 1933, respectively. The Ophir system has been modified, and now comprises essentially the facilities associated with the Combie-Ophir Canal, a branch of the Gold Hill Canal. In 1924, shortly after the formation of Nevada Irrigation District, a contract between the district and the company was negotiated wherein water developed by the district would be routed through the company's power system and subsequently returned to the district. This contract was

subsequently modified to meet new requirements of the district. This transfer of water is accomplished by diverting water developed by the district in the North and Middle Yuba Rivers watershed to Spaulding Powerhouse No. 3, which releases to Lake Spaulding. From Lake Spaulding the water is released for additional power generation by routing through either Spaulding Powerhouse No. 1, Drum, Dutch Flat, Halsey and Wise Powerhouses; or through Spaulding Powerhouse No. 2 to Deer Creek Powerhouse. Water which is diverted through Spaulding Powerhouse No. 1 is returned to the district at six locations for use in Placer County, and that diverted through Spaulding Powerhouse No. 2 is returned at the Deer Creek Powerhouse tailrace for use in Nevada County.

Pacific Gas and Electric Company diverts water under appropriations made by the company and its predecessors before and after the enactment of the Water Commission Act. The company's applications for appropriation made in accordance with the act are included in Table C-1.

For purposes of describing the company's facilities in the Yuba-Bear Rivers Hydrographic Unit, diversions are divided into three categories. These are the North Yuba River Power System, the South Yuba and Bear Rivers Power System, and the Placer Water System. The North Yuba River Power System is in the company's Colgate Division, and the South Yuba and Bear Rivers Power System and the Placer Water System are in the Drum Division.

The main features of these systems are depicted in detail on sheets 1 through 23 of Plate 2. In addition, the South Yuba and Bear Rivers Power and the Placer Water Systems are summarized on Plate 5.

North Yuba River Power System

The North Yuba River Power System includes Pacific Gas and Electric Company's diversions on the North Yuba River and its Narrows Powerhouse on the Yuba River. Diversion facilities located within this system divert water solely for the production of hydroelectric power.

Following are discussions of the diversion facilities within this system:

Bullards Bar Dam and Reservoir (Diversion 18N/7E-24D1).

Bullards Bar Reservoir, with a capacity of 31,490 acre-feet, was constructed on the North Yuba River in 1923-24 as a debris control structure to provide the required settling basin for upstream hydraulic mining. Construction of the dam was undertaken by a group of miners, headed by H. P. Whitney, to replace a smaller inadequate dam that was constructed in 1921. To take advantage of the storage facilities and hydraulic head provided by the new dam, Pacific Gas and Electric Company constructed the Bullards Bar Powerhouse at the foot of the dam, and diverted water through the powerhouse under a lease agreement with its owners. Later the company purchased the dam and reservoir.

The present installed generating capacity of the powerplant is 6,500 kilowatts. The water released from the reservoir through the powerplant is rediverted through Colgate Tunnel downstream.

Colgate Tunnel and Powerhouse (Diversion 18N/7E-25F1).

Colgate Tunnel and the diversion dam at the head of the tunnel were constructed by Pacific Gas and Electric Company in 1941 to

replace North Yuba Dam and Colgate Flume which supplied Colgate Powerhouse. A portion of the water diverted through the tunnel is used to supply Browns Valley Ditch under an agreement with Browns Valley Irrigation District. This is accomplished by releasing water to the ditch near the head of the penstock to the powerplant. This agreement and the history of these facilities are further discussed in the description of the facilities of Browns Valley Irrigation District.

In 1946 the original Colgate Powerhouse was damaged by fire, and was replaced in 1949 by a new plant. The present generating capacity of the plant is 24,000 kilowatts. Water for this diversion is regulated by storage in Bullards Bar Reservoir upstream.

Lake Francis (Diversion 17N/7E-5J1). Lake Francis was constructed in 1901 by the Yuba Electric Power Company to provide a supplemental water supply for Colgate Powerhouse. At that time, water was diverted by means of a wood stave pipe from the lake to the head of the powerplant penstock. When the Colgate Tunnel was constructed in 1941, the head of the penstock was elevated so that it was impossible to divert water through the pipe from the lake to the penstock. Therefore an agreement was made with Browns Valley Irrigation District to deliver Lake Francis water to the district in lieu of a similar amount of North Fork Yuba River water which was formerly delivered to the district through Colgate Flume. The lake water is delivered to the district by releasing it to Dobbins Creek, from which it is diverted into the Browns Valley Ditch.

Narrows Dam and Powerhouse (Diversion 16N/6E-14Q1).

Narrows Powerhouse was constructed by Pacific Gas and Electric Company in 1942 to take advantage of the releases from the previously constructed Narrows Dam, which forms Englebright Reservoir. This dam was constructed by the California Debris Commission in 1941. Water is taken from the reservoir through a tunnel constructed around the dam to the powerplant. The present installed generating capacity of the powerplant is 9,350 kilowatts.

All water stored in Englebright Reservoir and diverted through the powerplant is taken under appropriative water rights filed with the State by Pacific Gas and Electric Company.

South Yuba and Bear Rivers Power System

The South Yuba and Bear Rivers Power System includes upstream water storage facilities on the South Yuba River and the facilities to deliver this water to the downstream hydro-electric powerplants. Water diverted through this system is also the primary supply of the Placer Water System. In addition to water that is stored and diverted by Pacific Gas and Electric Company, water that is developed by Nevada Irrigation District is routed through the system for the generation of power.

Following are discussions of the diversion facilities within this system:

Lake Spaulding and Spaulding Powerhouse Nos. 1, 2, and 3 (Diversion 17N/12E-20H1). The original Spaulding Dam on South Yuba River was constructed by the South Yuba Water Company in 1892-93 to supplement the water supply to the South Yuba Canal.

The present dam, located about one-half mile downstream from the original structure, was constructed to a height of 225 feet in 1912-13. In 1916 the dam was raised to 260 feet, and in 1919 to its present height of 275 feet.

The reservoir created by Spaulding Dam is the main storage and regulatory facility in the South Yuba and Bear Rivers Power System. Water for the reservoir is supplied by runoff of the South Yuba River, releases from upstream storage facilities on the South Yuba River, and releases from Spaulding Powerhouse No. 3. Spaulding Powerhouse No. 3, with a generating capacity of 5,200 kilowatts, is supplied by the Nevada Irrigation District's Bowman-Spaulding Conduit, which transports water developed by the district in the Middle and North Yuba Rivers watersheds.

Water is stored in Lake Spaulding and released as required through a short tunnel at the left abutment of the dam to either Spaulding Powerhouse No. 1 or No. 2. Water that enters Spaulding Powerhouse No. 1 flows into the Drum Canal at the powerplant tailrace, while that released through Spaulding Powerhouse No. 2 enters the South Yuba Canal. The installed generating capacities of these powerplants are 6,400 kilowatts at Spaulding No. 1 and 3,370 kilowatts at Spaulding No. 2.

Upstream Reservoirs Releasing to Lake Spaulding.

Pacific Gas and Electric Company has a number of reservoirs located upstream from Lake Spaulding which are used to store winter runoff for subsequent release during the summer. These are: Blue Lake, Fuller Lake, Rucker Lake, Upper and Lower Feeley Lakes, Middle and Lower Lindsay Lakes, Lake Culbertson, Upper

Rock Lake, Lake Fordyce, Meadow Lake, Lake Sterling, White Rock Lake, Lake Van Norden, Kidd Lake, and Upper and Lower Peak Lakes. Water from Blue Lake, Fuller Lake, Rucker Lake, Feeley Lakes, Lindsay Lakes, Lake Culbertson, and Upper Rock Lake is released to the Bowman-Spaulding Conduit and reaches Lake Spaulding through Spaulding Powerhouse No. 3. The remaining lakes are located on tributaries of the South Yuba River upstream from Lake Spaulding, and water is released directly thereto.

The aggregate capacity of these reservoirs is 68,470 acre-feet, of which a total of 46,660 acre-feet is impounded in Lake Fordyce. Lake Fordyce Dam was constructed in 1873-81 by the South Yuba Canal Company, and was enlarged in 1914 to a height of 140 feet by Pacific Gas and Electric Company. Lake Van Norden Dam was constructed by the company in 1916. Dams at all other reservoirs were constructed by predecessors of the South Yuba Water Company.

Prior to construction of Bowman-Spaulding Conduit by Nevada Irrigation District, water from reservoirs tributary thereto was delivered to Lake Spaulding through the Fall and Texas Creeks Ditch. This ditch was abandoned when the Bowman-Spaulding Conduit was constructed.

South Yuba Canal and Deer Creek Powerhouse (Diversion 17N/12E-20J2). The South Yuba Canal was constructed in 1865 by the South Yuba Canal Company to provide additional water to the Bear River Canal, and to the mines in the Grass Valley and Nevada City areas. After the canal was acquired by Pacific Gas and Electric Company, the Deer Creek Powerhouse was constructed.

The plant was commissioned in 1908 as the first hydroelectric powerplant to be constructed by the new organization.

The South Yuba Canal conveys water which is released from Lake Spaulding through Spaulding Powerhouse No. 2 to Deer Creek Powerhouse on Deer Creek. The water is discharged from the powerplant to Nevada Irrigation District. The present generating capacity of the powerplant is 5,500 kilowatts.

A portion of the water diverted at the head of the canal is spilled to the Bear River for redirection to Boardman Canal or Dutch Flat Tunnel and Bear River Canal. The Boardman Canal normally receives this water.

Drum Canal and Powerhouse (Diversion 17N/12E-20J1).

Drum Canal and Drum Powerhouse were constructed in 1912-13 when Spaulding Dam was built. The construction was part of Pacific Gas and Electric Company's expansion to meet new demands for power service. Water was first delivered to the powerplant on November 26, 1913.

Water conveyed by Drum Canal is released from Lake Spaulding through Spaulding Powerhouse No. 1. The canal has a length of 8.5 miles to the Drum Powerhouse, which is located on the Bear River and has a generating capacity of 48,000 kilowatts.

Water discharged from Drum Powerhouse to the Bear River is redirected downstream, first to the Dutch Flat Tunnel and then to the Bear River Canal. Water may also be released from the powerplant forebay to Canyon Creek for redirection to the Boardman Canal system.

Additional water supply from Drum Canal is received at a point near Emigrant Gap through the Lake Valley Canal, which conveys water from the North Fork of North Fork American River. This is an import to the Yuba-Bear Rivers Hydrographic Unit which is discussed in the section of this report entitled "Imports and Exports."

Dutch Flat Tunnel and Powerhouse (Diversion 16N/11E-17E1)

Dutch Flat Tunnel and Dutch Flat Powerhouse were constructed in 1942-43 and commissioned on March 29, 1943. The system was constructed to utilize the hydraulic head available between the Drum Powerhouse tailrace and the Bear River Canal diversion dam. The water diverted to the tunnel is supplied almost in its entirety by the releases from Drum Powerhouse. The present generating capacity of the powerplant is 22,000 kilowatts.

Bear River, Wise, and South Canals; and Halsey and Wise Powerhouses (Diversion 15N/9E-22Q1). The Bear River Canal was constructed in 1852 to convey water from the Bear River near Colfax to near Auburn. It was one of the first canals in Placer County, and water was diverted for mining uses north of Auburn. This system was expanded in the late 1890's, when the South Yuba Water Company constructed powerplants at Newcastle and Auburn. These powerplants were closed in 1912 and 1914, respectively.

In 1916 the company constructed Halsey Powerhouse at the terminus of the present Bear River Canal, and in 1917 Wise Canal and Powerhouse were constructed to utilize the hydraulic head available between Halsey Powerhouse afterbay

and Auburn Ravine. In 1919 South Canal was constructed to convey the water from Wise Powerhouse tailrace to the American River. The generating capacity of each of these powerhouses is 12,000 kilowatts.

At present, the Bear River Canal conveys water to generate power in Halsey and Wise Powerhouses, to supply a portion of the Placer Water System, and to return a portion of the Nevada Irrigation District's mountain water supply.

A large portion of the water conveyed in the canal is South Yuba River water discharged from Drum Powerhouse.

The principal releases to the Placer Water System are made from Bear River Canal to the Ragsdale Tunnel and Upper Bowman Canals; from Wise Canal to the Fiddler Green and Lower Bowman Canals; and from South Canal to the Dutch Ravine, Lower Greeley, and Boardman Canals.

Deliveries to Nevada Irrigation District are made to Ophir Pipe and Edgewood Pump from the Fiddler Green Canal, to Rock Creek North Ditch from the Wise Canal, and to Auburn Ravine at two spills from the South Canal. Water is also released down the Bear River at the Bear River Canal diversion dam for rediversion by the district.

Alta Powerhouse. Alta Powerhouse is located on Towle Canal, a part of the Placer Water System. The powerplant was constructed by the South Yuba Water Company in 1902 to utilize the hydraulic head available in the water supply system. The present generating capacity of the powerplant is 2,000 kilowatts.

Placer Water System

The Placer Water System provides water service to most of the area along Highway 40 between Roseville and Baxter. The system served 13,466 acres of irrigated land and the urban areas listed in Chapter II of this report in the Yuba-Bear Rivers Hydrographic Unit in 1957. In addition, most of the water supplied to the American River watershed north of the North Fork American River was provided by this sytem.

The Placer Water System comprises the Boardman Canal system and those portions of the Bear River Canal system which distribute irrigation, domestic, municipal, and industrial water. The portion of the Boardman Canal system above Lake Alta and Alta Powerhouse is operated as part of Pacific Gas and Electric Company's power system.

The Boardman Canal was constructed in 1893 by the South Yuba Water Company. At that time irrigation was beginning to replace the declining hydraulic mining industry as a major water use.

At present, the Boardman Canal system comprises several connected canals of varying capacities, and numerous distribution laterals. Water is first diverted from the Bear River at 17N/11E-36D1, and taken through the Upper Boardman Canal to Canyon Creek in the American River watershed. The water passes down the creek for a short distance and is rediverted into Towle Canal (import diversion 16N/11E-21E1) which conveys it to Alta Powerhouse. From the powerplant to Lake Alta the canal is known as the Boardman Canal (lower). From Lake Alta

to Monte Vista it is called the Cedar Creek Canal, and from Monte Vista to its terminus at the Roseville Regulator it is again known as the Boardman Canal. Exclusive of laterals, the canal system is 73.7 miles in length from the Bear River to the Roseville Regulator.

The Boardman Canal system receives additional water at several points in its upper reaches. Canyon Creek runoff is diverted at Pulp Mill Canal (16N/10E-36Q1) and also at the Towle Canal diversion point. Pitman Ravine runoff is diverted at 16N/11E-9J1, and Little Bear River runoff may be diverted at the Alta Powerhouse afterbay (16N/10E-25P1). Water is also received from Drum Canal by releases from Drum Forebay to Canyon Creek for redirection into Towle Canal. The lower portion of the Boardman Canal system is recharged from the Bear River Canal system at several points.

Most of the water deliveries from the Boardman Canal system are made in the Auburn-Rocklin area. The principal laterals are Shirland, Greeley, Red Ravine, and Caperton Canals.

Those portions of the Bear River Canal system which are a part of the Placer Water System are principally the Ragsdale Tunnel Canal, Bowman Upper Canal, Bowman Lower Canal, Fiddler Green Canal and its laterals Fiddler Green-Boardman Diversion Canal and Lower Banvard Canal. Recharge to the Boardman Canal is effected at Ragsdale Tunnel Canal and Fiddler Green-Boardman Diversion Canal. In addition, releases are made from South Canal to Caperton Canal (Via Dutch Ravine Canal), Boardman Canal, and Lower Greeley Canal.
